I. Introduction

A. Qualifications

- 1. My name is Lauren J. Stiroh. I am an economist and Senior Vice President of NERA Economic Consulting. NERA was founded in 1961 and provides research and analysis in the field of applied microeconomics, including the economics of competition, regulation, and finance. A substantial portion of NERA's consulting work, as well as my own work, is in the determination of economic damages.
- 2. I have provided economic consulting services and testimony in a number of antitrust liability and damages cases and have testified at trial and in deposition regarding a variety of business practices. These include, for example, commercial disputes, business interference, breach of contract, allegations of monopolization, price predation, unlawful tie-ins, price discrimination, abuse of market power, and patent infringement. I have experience with damages issues in a range of industries including industrial chemicals, automotive services, consumer products, pharmaceuticals, biotechnology, medical devices, agricultural products, advertising and promotion, and semiconductors.
- 3. I received my Ph.D. in economics from Harvard University in 1996. Prior to that, I received my B.A. in economics from the University of Western Ontario in 1990, and my M.A. from the University of British Columbia in 1991. My curriculum vitae, which includes a list of my prior expert testimony, is appended to this report as **Exhibit 1**. NERA is being compensated at my usual rate of \$700 per hour. NERA's compensation does not depend on the outcome of this litigation.

B. Assignment

4. I have been asked by counsel for Adobe Systems Inc. ("Adobe"), Apple Inc. ("Apple"), Google Inc. ("Google"), and Intel Corp. ("Intel") to review and comment on the theories and calculations in the merits report of Dr. Edward E. Leamer, expert for Plaintiffs in connection with *In re: High-Tech Employees Antitrust Litigation*. In particular, I have been asked to opine on the conclusions reached by Dr. Leamer that the alleged actions of Adobe, Apple, Google, Intel, Intuit Inc. ("Intuit"), Lucasfilm Ltd. ("Lucasfilm"), and Pixar (collectively "Defendants") suppressed compensation to the Class from March 2005 to March

¹ Expert Report of Edward E. Leamer, Ph.D., October 28, 2013 ("Leamer October 2013 Merits Report").

² It is my understanding that Intuit, Lucasfilm, and Pixar have reached settlements in this matter.

2009 (the "Class period") through the use of "Do Not Cold Call" or "DNCC" agreements, and to examine the model he uses to calculate damages.³

C. Materials Relied Upon

- In preparing this report, I, and economists working under my direction, have 5. reviewed the Expert Report of Edward E. Leamer, Ph.D. submitted October 28, 2013 and documents and data referenced therein, in addition to Dr. Leamer's reports in this matter submitted October 1, 2012, December 10, 2012, May 10, 2013 and July 12, 2013 and documents and data referenced therein. ⁴ I have also reviewed the Expert Report of Professor Kevin M. Murphy submitted January 17. 2013, the Supplemental Expert Report of Professor Kevin M. Murphy submitted June 21, 2013, the Expert Witness Report of Kevin F. Hallock submitted May 10, 2013, the Expert Witness Report of Kevin F. Hallock submitted October 27, 2013, the Expert Report of Kathryn Shaw, Ph.D. submitted June 21, 2013, the Expert Report of Alan Manning, Ph.D. submitted October 28, 2013 and the Expert Report of Matthew Marx submitted October 28, 2013, and documents and data referenced therein. I, or members of my team, have also reviewed additional documents, declarations and deposition testimony produced in connection with this case, as well as other publicly available information.
- 6. The opinions expressed in this report are based on my analysis and research conducted for this report, and my training and experience as an economist. A complete list of the sources of information and materials I relied upon in forming my opinion is presented in **Exhibit 2**. In addition to the materials listed in **Exhibit 2**, I, and members of my team, have had conversations with Frank Wagner, Director of Compensation at Google, and Danny McKell, Compensation and Benefits Specialist at Intel.

D. Summary of Opinions

7. Based on my analysis to date, I have reached the following opinions:

³ Plaintiffs seek to represent a nationwide Class of "salaried technical, creative, and research and development employees who worked for any Defendant while that Defendant participated in at least one anti-solicitation agreement with another Defendant." (Order Granting Plaintiffs' Supplemental Motion for Class Certification, *In re: High-Tech Employee Antitrust Litigation*, Case No. 5:11-CV-02509-LHK, October 24, 2013 ("Order Granting Plaintiffs' Supplemental Motion for Class Certification"), p. 10.)

⁴ These reports are titled the Expert Report of Edward E. Leamer, Ph.D., October 1, 2012 ("Leamer October 2012 Report"), the Reply Expert Report of Edward E. Leamer, Ph.D., December 10, 2012 ("Leamer December 2012 Reply Report"), the Supplemental Expert Report of Edward E. Leamer, Ph.D., May 10, 2013 ("Leamer May 2013 Supplemental Report") and the Rebuttal Supplemental Expert Report of Edward E. Leamer, Ph.D., July 12, 2013 ("Leamer July 2013 Rebuttal Supplemental Report").

- a. The theories that Dr. Leamer relies upon to establish impact and damages are flawed and unsupported by his data or analyses. There is no evidence to support Dr. Leamer's assertion that impact was widespread or can be properly measured by the methods and models he employs. To the contrary, data and information produced in this case suggest that the information flow during the Class period was not impeded in any meaningful fashion. Dr. Leamer's impact and damages estimates are the result of flaws in his model and the failure of his model to account for the overall economic climate, firm specific actions, or outside events.
- b. Despite occasional decreases in average total compensation, the overall trend from 2001 through 2011 has been for the average Class member's compensation to increase over time. There is substantial volatility in average total compensation, average base salary, average bonus and average equity, and there does not appear to be any consistent pattern of changes to compensation practices at these firms concurrent with the timing of the DNCC agreements.
- c. Plaintiffs' theory of harm does not support damages to the entire Class. The amount of information allegedly restricted through DNCC agreements was only one of many potential sources of "price discovery" information available to employees. The impact of the restrictions on cold-calling would have, at most, reduced information to specific employees about specific opportunities.
- d. The amount of information that might reasonably have been restricted by DNCC agreements is small. Transfers between firms with DNCC agreements represented only a very small fraction (0.2 percent) of the new hires at Defendant firms even before the Class period. In addition, the percentage of a Defendant's new hires coming from a firm with which it had a DNCC agreement did not substantially decrease during the Class period. As overall hiring did not decrease during the Class period, and the percent of new hires between companies with a DNCC agreement was small before, during and after the Class period, there is no basis to assume that the amount of "price discovery" information was lessened during the Class period.
- e. Dr. Leamer's analyses attempting to show the so-called "ripple effect" do not provide evidence of a "somewhat rigid" pay structure that would cause the impact of fewer cold calls from companies in a DNCC agreement to be broadly felt.⁵
- f. Dr. Leamer's model for estimating alleged Class-wide impact and damages suffers from numerous flaws that make it unreliable. The model suffers from specification errors and is improperly specified to test the theory of harm alleged. The model

-

⁵ I will use the term "ripple effect" to refer to what Dr. Leamer has referred to in various ways to describe his theory that the impact of a cold call is allegedly spread beyond the recipient of the call. (Leamer October 2013 Merits Report, ¶ 14 and Leamer October 2012 Report, ¶ 104.)

Introduction

yields counter-intuitive and implausible results that are inconsistent with Plaintiffs' theory of harm or well-established relationships in labor economics. The model is not robust to changes in specification and as a result "damages" are greatly diminished or eliminated entirely when minor changes are made to the specification. Adjusting the model to correct certain flaws in the model result in no Class-wide impact from these agreements.

- g. Reasonable alterations to Dr. Leamer's model substantially change the estimated damages figure and cast serious doubt on the model's ability to properly assign damages. Adjusting Dr. Leamer's model to use nominal figures, as employers did not have perfect information about the future inflation prior to setting compensation, substantially reduces what he believes to be damages caused by the alleged conduct. Similarly, adjusting to allow for varying impact of conduct by firm, as compensation practices differ at each firm, substantially reduces or eliminates the alleged damages. And, adjusting Dr. Leamer's model to isolate the impact of hiring at firms with a DNCC agreement from the impact of hiring at firms without a DNCC agreement, substantially reduces or eliminates the purported damages.
- h. The "conduct" variable Dr. Leamer uses does not support his theory of harm, nor does it accurately measure the alleged information loss as a result of the agreements at issue. In fact, it is inaccurate for Dr. Leamer to call it a "conduct" variable. It is simply a time indicator that captures all changes in compensation that have not otherwise been accounted for during the alleged Class period. As a result, there is no basis to assume that the effect that Dr. Leamer appears to be measuring arises from a reduction in information flow as opposed to other microeconomic and macroeconomic factors that occurred concurrent with the Class period but are omitted from his damage analysis.
- i. Numerous events occurred in the Class period that affected compensation at the Defendants' firms, independent of any alleged "conduct" but are unaccounted for in Dr. Leamer's model. For example, the model does not account for the impact of the 2008-2009 recession during the alleged Class period. It does not allow for variation in how each of the Defendants responded to the recession when setting compensation. It cannot identify employees who continued to receive pay increases based on cold-calls or raises due to pressure from non-Defendant rival employers. And, it conflates the impact, if any, of the challenged agreements with the impact of concurrent agreements with similar terms that are not at issue in this case. The inability of Dr. Leamer's model to disentangle the impact of the alleged conduct at issue from the effect of independent events on compensation makes his damage model unreliable and entirely incapable of measuring the effect of the alleged conduct at issue.

The Nature of the Case

II. The Nature of the Case

A. The Alleged Conspiracy to Suppress Wages

- 8. According to the Complaint, Defendants Adobe, Apple, Google, Intel, Intuit, Lucasfilm, and Pixar conspired to create "an interconnected web of express agreements" not to cold call each other's employees for the purpose of recruiting. Plaintiffs define cold calling as including "communicating directly in any manner (including orally, in writing, telephonically, or electronically) with another firm's employee who has not otherwise applied for a job opening." Plaintiffs claim Defendants conspired to suppress and did suppress compensation to "salaried technical, creative, and research and development employees" ("TCR employees") by agreeing not to cold call each other's employees. Plaintiffs allege that "under competitive and lawful conditions, Defendants would use cold calling as one of their most important tools for recruiting and retaining skilled labor, and the use of cold calling among Defendants commonly impacts and increases total compensation and mobility of all Defendants' employees."
- 9. Named Plaintiffs in this case are Michael Devine, a former software engineer for Adobe; Mark Fichtner, a former software engineer for Intel; Siddharth Hariharan, a former software engineer for Lucasfilm; Brandon Marshall, a former software engineer for Adobe; and Daniel Stover, a former software engineer for Intuit. The named Plaintiffs seek to represent a nationwide Class of "salaried technical, creative, and research and development employees who worked for any Defendant while that Defendant participated in at least one anti-solicitation agreement with another Defendant" and seek damages allegedly resulting from any loss of compensation they suffered as a result of the agreements at issue. ¹¹

⁶ Consolidated Amended Complaint, *In re: High Tech Employee Antitrust Litigation*, Case No. 5: 11-CV-2509-LHK, September 2, 2011 ("Complaint") ¶¶ 55, 58–9, 73, 79, 85, 98, and 104. The Plaintiffs' Supplemental Answers and Objections to Defendants' Second Set of Interrogatories describe the agreements for which the Plaintiffs seek damages. (Plaintiffs' Supplemental Answers and Objections to Defendants' Second Set of Interrogatories, May 24, 2013 ("Plaintiffs' Supplemental Answers to Interrogatories").) Intuit, Lucasfilm, and Pixar have entered into settlement agreements with the Plaintiffs. (Order Granting Plaintiffs' Motion for Conditional Class Certification and Preliminary Approval of Partial Class Action Settlements with Defendants Intuit Inc., LucasFilm, Ltd., and Pixar, Approving Form and Manner of Notice, and Scheduling Final Approval Hearing, October 30, 2013.)

⁷ Complaint, ¶ 41.

⁸ Complaint, ¶¶ 108 − 10. ("Defendants entered into, implemented, and policed these agreements with the knowledge of the overall conspiracy, and did so with the intent and effect of fixing the compensation of the employees of participating companies at artificially low levels.")

⁹ Complaint, ¶ 54.

¹⁰ Complaint, ¶¶ 16 – 20.

¹¹ Order Granting Plaintiffs' Supplemental Motion for Class Certification, p. 10 and Complaint ¶¶ 123 and 126.

- 10. The alleged agreements are between pairs of Defendants that purportedly restricted recruiting between the parties to each agreement. I understand that the agreements at issue in this litigation consist of the following: Adobe-Apple; Apple-Pixar; Apple-Google; Google-Intel; Google-Intuit, and Lucasfilm-Pixar. ¹² According to Dr. Leamer's analysis, these agreements became effective May 2005, April 2007, February 2005, March 2005, June 2007 and pre-2000, respectively, and enforcement of all the agreements at issue ended in March 2009. ¹³ Dr. Leamer's October 2012 report listed additional agreements between Pixar-Intel, Apple-Intel, Apple-Intuit and Apple-Lucasfilm. ¹⁴ However, Dr. Leamer has dropped these agreements from his analysis in his merits report, presumably because Plaintiffs do not challenge these agreements. Finally, it is my understanding from counsel that Intel's participation in a DNCC agreement with Google may have begun in spring of 2006, as opposed to spring of 2005, and that until the spring of 2006, there was no bi-lateral agreement between Google and Intel, only a unilateral decision by Google to stop cold calling Intel.¹⁵
- 11. I understand that some of the agreements at issue in this litigation are characterized as informal, unwritten agreements in which senior management in certain pairs of Defendant companies allegedly agreed not to cold-call each other's employees. ¹⁶

It is my understanding that certain allegations by Plaintiffs indicate that the Google-Intuit agreement only consisted of an agreement that Google not cold call Intuit employees, with no agreement prohibiting Intuit from calling into Google. However, I am assuming for the purposes of this report the broadest potential scope of Plaintiffs' claims with respect to Google-Intuit (i.e., that it was a reciprocal agreement), without verifying or testing that assumption. See Plaintiffs' Notice of Motion and Motion for Class Certification, and Memorandum of Law in Support, *In re: High-Tech Employee Antitrust Litigation*, Case No.: 5:11-CV-02509-LHK, October 1, 2012, p. 13 (Intuit Chairman Bill Campbell "also insisted that Google agree not to recruit Intuit employees.") and Plaintiffs' Supplemental Motion and Brief in Support of Class Certification, *In re: High-Tech Employee Antitrust Litigation*, Case No.: 5:11-CV-02509-LHK, May 10, 2013, p. 9 ("Mr. Campbell 'requested that Intuit be added fully to the Do Not Call list'... Google agreed to Mr. Campbell's request.")

Leamer October 2012 Report, p. 9. For the purposes of this report, I take the agreement dates identified by Dr. Leamer in his October 2012 report as given, except where noted. However, there appear to be unexplained disparities between the dates he provides in his October 2012 and his October 2013 report. For the purposes of the analyses in this report, I take the dates as set out in Dr. Leamer's regression data as given, unless otherwise noted. Dr. Leamer notes that the Apple-Pixar agreement may have begun prior to 2005 but states that he does not use this date due to lack of supporting evidence. (Leamer October 2013 Merits Report, FN 4.) In addition, Plaintiffs' Supplemental Answers and Objections to Defendants' Second Set of Interrogatories provide some dates for the agreements that differ from those provided by Dr. Leamer. (Plaintiffs' Supplemental Answers to Interrogatories.)

¹⁴ Leamer October 2012 Report, pp. 9 – 10.

¹⁵ I understand that the earliest documentation of an agreement between Intel and Google is a May 2006 email between Paul Otellini, CEO of Intel, and Eric Schmidt, CEO of Google. (Email exchange "FW: recruiting," between Paul Otellini and Eric Schmidt, May 2006, GOOG-HIGH-TECH-00058864.) Mr. Otellini testified that his May 2006 email followed a telephone call that he had with Mr. Schmidt earlier in the spring of 2006, where Mr. Otellini asked Mr. Schmidt not to cold call Intel's employees who were working on collaborations with Google and that Mr. Schmidt agreed. (Otellini Dep. 74 – 76 and 111 – 16).

¹⁶ Email exchange "Re: Apple – Possible Target," between Ray Tum at Adobe and Martin Bruce at Adobe, May 2006 ("Apple Possible Target"), ADOBE_007186 in ADOBE_007186 – 7; Email exchange "Apple gentleman's agreement," between Lori McAdams at Pixar and recruiting divas at Pixar, April 2007 ("Apple-Pixar agreement outline"), PIX00003419 and Email exchange "Re: Pixar agreement," between Jan van der Voort at Lucasfilm and Sharon Coker at Lucasfilm and BZ Petroff at Lucasfilm, April 2007 ("Pixar agreement"), LUCAS00013507. Internal Intel emails describe the Intel-Google

As such the understanding and implementation of the terms and restrictions of the agreements at issue may vary from agreement to agreement and may, in fact, even differ between the two parties to each agreement.

B. Dr. Leamer's Theory of Impact

- 12. Dr. Leamer was retained by Plaintiffs to assess impact and damages to the Class allegedly resulting from the DNCC agreements. Dr. Leamer opines that the DNCC agreements reduced the information available to Class members about their market worth and allowed Defendants to undercompensate the Class relative to what Class members would have earned absent the DNCC agreements.
- 13. Dr. Leamer characterizes the process by which employees and employers determine labor contracts when there is imperfect information about the prices being negotiated in the market as a process of "price discovery." He claims that "[m]embers of the Class work in a market characterized by imperfect information," with the employee having less information than the firm about market wages. Dr. Leamer argues that the DNCC agreements suppressed an important source of information about market wages and negatively impacted the employees' compensation by allowing the Defendants to undercompensate their employees with less fear of losing them to competitors. 19
- 14. According to Dr. Leamer, "when employees discover information regarding their labor's value by receiving an offer from a competing employer, those employees use that information to negotiate higher salaries at their current employer." Under this theory, with less information allegedly flowing in to employees through cold calls, employees would allegedly be less informed about their market worth and unable to negotiate as strongly for compensation commensurate with their worth.
- 15. Dr. Leamer states the impact of foregone cold calls affects the wage structure of the entire firm through the "force of internal equity." According to Dr. Leamer,

agreement as an "unofficial no poaching policy" and a "handshake 'no recruit." (Re: fyi, 76526DOC000007 and Email chain "Re: global gentleman agreement with Google," between Intel employees, September 2007 ("Re: global gentleman agreement with Google"), 76526DOC000011 in 76526DOC000011 - 4.) While Plaintiffs allege other restrictions, the common alleged restriction in the agreements was an alleged promise not to cold call.

¹⁷ Leamer October 2013 Merits Report, ¶¶ 11 – 12.

¹⁸ Leamer October 2013 Merits Report, ¶¶ 11 – 12.

¹⁹ Leamer October 2013 Merits Report, ¶¶ 9 and 12. ("There can be a normal asymmetry in information that works in favor of employer, since employees may have little or no direct access to the nature of contract offered and accepted by other similar workers either at their own firm or other firms, and workers may rely mostly on "water-cooler talk" perhaps supplemented by Internet sources...Cold calling is an important channel of information about outside opportunities that can help employees become better informed and better paid.")

²⁰ Leamer October 2012 Report, ¶ 113.

²¹ Leamer October 2013 Merits Report, ¶ 14.

- "internal equity puts boundaries on the degree to which pay of different employees can diverge, and tends to require maintenance of a somewhat rigid compensation structure." That is, under Dr. Leamer's theory, when one employee negotiates higher compensation, firms are allegedly pressured to raise compensation for all employees, such that information from cold calls has a "ripple effect" that causes the increase in compensation to be propagated through the Defendants' "somewhat rigid" compensation structures.²³
- 16. Dr. Leamer further alleges that the ripple effect occurs both reactively and preemptively. As employees learn from each other that others received an increase in compensation, they put pressure on the employer to "match compensation increases broadly." According to Dr. Leamer the adherence to a "rigid salary structure" helps keep employees loyal to the firm. Dr. Leamer also alleges that even the potential for a "burst" of cold calls from a recruiting company causes firms to preemptively increase compensation to employees to prevent them from leaving to competitors. These preemptive increases "reduce or eliminate" the effectiveness of future cold calls to the firm's employees. Py preventing cold calling through the DNCC agreements, Dr. Leamer alleges the Defendants bypassed this pressure to reactively and preemptively increase compensation and negatively impacted the entire Class.
- 17. Finally, Dr. Leamer suggests that "profit-sharing" between the firm's top management and its key employees was reduced during the Class period. 29 According to Dr. Leamer's profit sharing theory, firms share profits with key employees that possess critical firm-specific knowledge to prevent them from

²² Leamer October 2013 Merits Report, ¶ 14.

²³ Leamer October 2012 Report, ¶ 120. ("A firm's commitment to principles of 'internal equity' is evidenced by the imposition and maintenance of a somewhat rigid salary structure. What that means is that Cold-Calling and related practices would be expected to increase compensation across the board rather than be narrowly focused on the skills that are most in demand at any point in time.")

²⁴ Leamer October 2012 Report, ¶ 114. ("...[T]hose individuals tell others at their employer, who then 'resent[]' the perceived 'unfair jump' in pay, increasing pressure to match compensation increases broadly.")

²⁵ Leamer October 2012 Report, ¶ 101. ("...[E]conomic theory implicating firm incentives to maintain worker loyalty by adhering to principles of internal equity through a rigid salary structure....")

²⁶ Leamer July 2013 Rebuttal Supplemental Report, ¶¶ 3 − 4 and 24 ("Preemptive adjustments are intended to minimize the damage that attractive cold calls might cause to the behavior of not just the individuals who (in the but-for world) would have been cold-called–but also the broad swath of employees whose loyalty might be diminished by knowledge of better opportunities via cold calls received by their colleagues."); Leamer May 2013 Supplemental Report, ¶ 15 and Leamer October 2012 Report, ¶ 105.

²⁷ Leamer October 2013 Merits Report, ¶ 8.

²⁸ Leamer October 2012 Report, ¶ 82. ("Documents reveal that the defendants would otherwise have been competing for employees. In the absence of these agreements, Defendants would have cold called one another's employees.")

²⁹ Leamer October 2012 Report, ¶ 97.

leaving and taking that knowledge away from the firm.³⁰ By suppressing workers' information about outside opportunities, Dr. Leamer alleges that the Defendants decreased the need to share profits with critical employees, allowing the firms' top management to potentially keep a larger share of the firms' profits during the Class period.³¹

18. The theories on which Dr. Leamer relies to establish impact and damages are flawed and unsupported by his data or analyses. There is no evidence to support Dr. Leamer's assertion that the impact of the DNCC agreements at issue was widespread or can be properly measured by the methods or models used by Dr. Leamer. To the contrary, data and information produced in this case indicate that information flow during the Class period was not impeded in any meaningful fashion. Overall hiring (and the attendant information flow from all sources) increased at the Defendant firms over the Class period as did average compensation to employees. The damage results obtained by Dr. Leamer are the result of fundamental flaws in his model and the failure of his model to account for individualized compensation factors for each firm, such as each firm's reaction to the economic slowdown in 2008 and 2009 and many other firm-specific factors.

III. Background

A. Defendants' Compensation Practices

19. This section explores overall compensation trends and practices at each Defendant firm. I detail the types of compensation granted to each Defendant's TCR employees and explore events that had a noticeable impact on compensation at each of these firms, as shown by the data and in Defendants' documents. The data and documents show that total compensation and average compensation per Class member at each Defendant firm tended to increase throughout the Class period, and that a variety of events occurred throughout this period that impacted Defendants' compensation, independently of the DNCC agreements at issue.

³⁰ Leamer October 2012 Report, ¶¶ 78 − 9 and 97. ("Equity grants and profit sharing are used to promote employee loyalty and retain firm-specific knowledge assets....")

³¹ However, Dr. Leamer acknowledged in deposition that possible savings from the alleged suppression of compensation could be invested in new capital, research and development, or hiring more people, rather than be given to top management or the principals of the companies. Deposition of Dr. Edward Leamer, November 18, 2013 ("Leamer Deposition Vol. III."), pp. 973 – 6. ("Q. Is that your opinion that in this case, the defendants kept more of the profits for the firm's principals and top management? A. Yes, that is. So the damages that I refer to are wages that would, absent the agreement, have accrued to workers...Q. But it doesn't necessarily follow that if there is a savings because of your alleged suppression of compensation, that the savings go to the principals and top management... Q. ...But it could go into plant investment, research and development? A. It could. It could. Q. It could go into hiring more people. It could go into any cash needs that the company has; right? A. Yes, it could.")

Background

1. Adobe

a. Compensation Overview

20. **Exhibit III.1** shows the total number of TCR employees employed by Adobe annually from 2001 to 2011. As can be seen from the chart, Adobe gained over 1,000 TCR employees between 2001 and 2011. The biggest growth year for Adobe was 2005, when Adobe acquired Macromedia, adding 655 TCR employees to Adobe's total. Between 2005 and 2009 Adobe acquired 13 additional companies further expanding the number of Class members it employed during the Class period. 33

(Exhibit III.2). Adobe's average compensation per Class member generally mirrors the pattern in total compensation expenditure, as shown by Exhibit III.3.

b. Compensation Components

22.

³² Dr. Leamer's Adobe compensation data. According to Ms. Morris, the acquisition of Macromedia led to approximately 1,200 employees (both technical and non-technical) being added to Adobe's headcount. (Declaration of Donna Morris, Senior Vice President, Global Human Resources, at Adobe, November 9, 2012 ("Morris Declaration"), ¶ 35.)

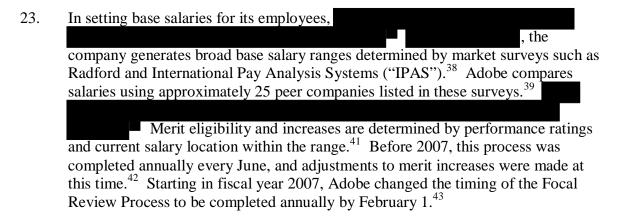

³³ Morris Declaration, ¶ 36. ("After Macromedia, Adobe continued to make acquisitions, including the acquisition of Navisware...TTF, Pixmantec, Interakt, Amicima, Serious Magic, and Antepo...Scene7 and Virtual Ubiquity... Meer Meer and Yawah... and Business Catalyst and Omiture....")

2. Apple

a. Compensation Overview

- 29. The total number of TCR employees employed by Apple increased steadily during the relevant period, almost tripling in count between 2001 and 2011, as shown by **Exhibit III.9**. Apple expanded its TCR workforce by 51 percent during the alleged Class period, from 2005 to 2009.
- 30. Between 2001 and 2011, Apple saw steady growth in its total compensation to its TCR employees, with annual total compensation more than quadrupling, as shown by **Exhibit III.10**. Average compensation per Class member also trended upward over the relevant period. **Exhibit III.11** shows the average compensation increasing in most years from 2001 through 2011.

b. Compensation Components

- 31. Total employee compensation at Apple is composed of: base salary, a variety of bonuses, and two forms of equity grants (stock options and RSUs).⁶²
- In setting the base salaries of its employees, Apple utilizes market information including the Radford survey, to create salary ranges for its jobs

 . O4 As of 2006, Apple documents suggested that the company targeted its cash compensation at or above the median in the market. Each year, Apple sets a compensation budget, and managers are responsible for determining

⁶¹ Dr. Leamer's Adobe compensation data.

⁶² Declaration of Steven Burmeister, Senior Director of Compensation at Apple, November 12, 2012 ("Burmeister Declaration"), ¶ 3.

⁶³ Burmeister Declaration, ¶¶ 4 and 6.

⁶⁴ Burmeister Declaration, ¶ 4. ("In 2009, for example, Apple identified the following as peer companies for compensation purposes: Amazon.com, Inc., AT&T Inc., Cisco Systems, Inc., Comcast Corporation, Dell Inc., DIRECTV, eBay Inc., EMC Corporation, Google Inc., Hewlett-Packard Company, Intel Corporation, International Business Machines Corporation, Microsoft Corporation, News Corporation, Oracle Corporation, QUALCOMM Incorporated, Texas Instruments Incorporated, Time Warner Inc., Verizon Communications Inc., The Walt Disney Company, and Yahoo! Inc.")

^{65 &}quot;Compensation," Apple Presentation for Recruiters, May 2006 ("Apple Compensation Presentation"), 231APPLE021326 in 231APPLE021322 – 34. ("Apple's Compensation Committee of the Board of Directors approved a compensation philosophy whereby total cash compensation is at or above median...")

the compensation of those they supervise based on merit and needs of the individual group. 66 Each manager allocates salary increases within his or her budget. 67 The market data utilized by Apple also help determine the annual compensation budgets. 68

- 33. Salaries at Apple are reviewed annually, and eligible employees are considered for an annual merit increase. As of at least 2005, annual merit increases were effective in early December. The percentage increases ranged from percent and were determined by an employee's performance rating. The average base salary of Apple's TCR employees increased annually from 2001 through 2011, as shown by **Exhibit III.12**.
- 34. Apple also provides a variety of cash and equipment bonuses to its employees. These include an annual performance bonus as well as among others. As of at least 2006, the annual performance bonus was "74" Exhibit III.13 shows the average bonus paid to Apple TCR employees from 2001 through 2011. Average bonuses are generally increasing with the exception of 2003, 2005, 2008, and 2010. Exhibit III.14 shows that the average cash compensation (i.e., includes base salary plus bonuses) to Apple TCR employees increased annually between 2001 and 2011.

("Human Resources Manager Briefing," Fall 2005 ("Apple Manager Briefing"), 231APPLE094053 in 231APPLE094041 – 67.)

(Burmeister Declaration, ¶ 4 and "Total Rewards Planning"), (Exhibit C to the Burmeister Declaration), 231APPLE095049 in 231APPLE095044 – 63.)

⁶⁶ Burmeister Declaration, ¶¶ 3 and 7.

⁶⁷ Burmeister Declaration, ¶ 7.

⁶⁸ Burmeister Declaration, ¶ 6.

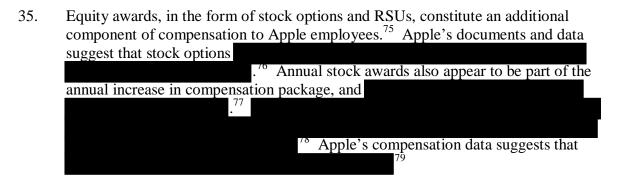

⁷⁰ Apple has adjusted its compensation budget annually for the last eight years, and adjusted them "periodically" prior to that.

⁷¹ Apple Manager Briefing, 231APPLE094943 in 231APPLE094041 – 67.

⁷² Apple Manager Briefing, 231APPLE094950 in 231APPLE094041 – 67.

⁷³ Dr. Leamer's Apple compensation data.

⁷⁴ Apple Total Rewards Planning, 231APPLE095048.

36. **Exhibit III.15** and **Exhibit III.16** show that while the average value of stock options awarded to TCR employees decreased from 2007 through 2009, the average value of total equity grants to TCR employees increased year on year with the exception of a drop prior to the Class period in 2002 and a drop in 2008. When looking at each of the components of compensation, equity value appears to be the source of the decline in average compensation to the Class in 2008. The drop in equity value in 2008 coincides with a substantial decline in the fair value price of Apple's stock.

⁷⁵ Burmeister Declaration, ¶ 3. Apple also offers an employee stock purchase plan. ("Form DEFR14A," Apple, January 26, 2010, (Exhibit A to the Burmeister Declaration), p. 22.)

⁷⁶ Apple Compensation Presentation, 231APPLE021331. ("

⁷⁷ Apple Total Rewards Planning, 231APPLE095048. ("

^{.&}quot;)
⁷⁸ As of 2006,

⁽Apple Total Rewards Planning, 231APPLE095049 and Apple Compensation Presentation, 231APPLE021330.)

⁷⁹ Dr. Leamer's Apple compensation data. Dr. Leamer's compensation data suggests

⁸⁰ See Exhibits III.11 – III.16.

Apple's fiscal year ("FY") closes on September 30, and therefore, the fair value prices reported for a given FY cover only nine out of 12 months of the same calendar year. The three remaining months of the calendar year are evaluated at the fair value prices of the next fiscal year. There was a drop in the fair value price of RSUs in FY 2009, from \$163 in FY 2008 to \$112 in FY 2009, that caused a decrease in the weighted average fair value price of RSUs in 2008. Due to the large volume of RSUs allocated in October 2008, which fell into fiscal year 2009, most of the RSU grants in 2008 were evaluated using FY 2009's depreciated fair values. (Dr. Leamer's regression data.)

3. Google

a. Compensation Overview

- 37. From 2001 to 2011, the number of Google's TCR employees increased more than 100-fold as it went from a California technology startup to a publicly traded company. ⁸² **Exhibit III.17** shows the growth in Google's TCR employees between 2001 and 2011.
- As its TCR workforce grew, Google's total expenditure on TCR employee compensation also increased on an annual basis, with the exception of 2008, as shown by **Exhibit III.18**. Between 2005 and 2009, total compensation received by the Class grew by Google's average compensation per TCR employee shows greater volatility than the other firms studied. As shown by **Exhibit III.19**, average compensation of TCR employees between 2002 and 2003. While Google's average compensation per Class member shows substantially more variability during the Class period, overall, its average compensation remains generally higher than that of the other Defendants.

b. Compensation Components

- 39. Google's total employee compensation is composed of: base salary, annual employee bonus, and two forms of equity grants (stock options and Google Stock Units, "GSUs," which are similar to restricted stock units). 83
- 40. In setting the base salary of its employees, Google conducts an annual market benchmarking process to generate market reference points ("MRPs") for each combination of job code and region at the company. Over time, Google has raised its target market benchmark percentiles for cash compensation using wage surveys. Prior to 2007, Google targeted cash compensation around the of the market, and increased this target to the fin 2007. In 2011, Google increased the target further to the percentile of the benchmark data. Data for MRPs come from a variety of market surveys including surveys by

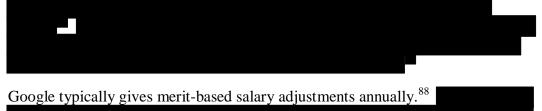

⁸² Google filed their IPO in August of 2004, offering 19,605,052 shares of Class A Common Stock at an opening price of \$85 a share. ("Our history in depth," Google ("Google History") available at http://www.google.com/about/company/history/#2004, accessed on November 9, 2013.)

⁸³ Declaration of Frank Wagner, Director of Compensation at Google, November 9, 2012 ("Wagner Declaration"), ¶¶ 5 and 25. GSUs are similar to restricted stock units, but differ in that "as long as units are unvested, holders are not entitled to voting rights or dividends, if any." (Google's Hiring Policies and Protocols, December 17, 2007 ("Google's Hiring Policies and Protocols"), GOOG-HIGH TECH-00023555 in GOOG-HIGH-TECH-00023500 − 601.)

⁸⁴ Wagner Declaration, $\P\P 6 - 7$.

⁸⁵ Deposition of Frank Wagner, Director of Compensation at Google, March 7, 2013 ("Wagner Deposition"), pp. 39 – 40.
("A....So in 2007 we changed our compensation philosophy to increase our market targeting for our cash compensation. Q. And what did that involve? A.

41.

- Google typically gives merit-based salary adjustments annually. 88
- 42. **Exhibit III.20** shows average base salary per TCR employee at Google between 2001 and 2011. Average base salary increased annually for Class members in the relevant period with the exception of a slight drop in 2006. The decrease in average base salary in 2006 is concurrent with a change in the mix of employees in 2006 relative to 2005. The Class members who left Google after 2005 were higher paid on average relative to those who stayed and the new hires in 2006, which lowered the average salary in 2006. 92

A. It was decided in 2010 we would change the compensation philosophy for implementation at the beginning of 2011...Moving from targeting the market to targeting—for cash compensation to targeting the market compensation," Google ("Google Rewarding Talent: Compensation"), GOOG-HIGH-TECH-00195943.pptx, slide 13. Previously, Google gave each employee a job level (1 through 9) and "control points" or ladders (T for Technical, O for (Wagner Deposition, pp. 47 – 8 and 56 – 7.)

86 Wagner Declaration, ¶ 7 – 8.

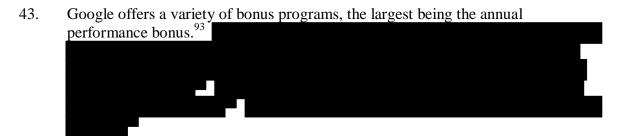

⁸⁸ Wagner Declaration, ¶ 15.

⁸⁹ Deposition of John Schirm, Compensation Manager at Google, June 29, 2012, p. 97 and "Salary Planning 2007 Presentation to Engineering Managers," Google, October 30, 2007, (Exhibit A to the Wagner Declaration), GOOG-HIGH TECH-00255218.000007 in GOOG-HIGH TECH-00255218.000001 – 16.

⁹⁰ Wagner Declaration, ¶ 15 and Rewarding Talent: Compensation, slide 16.

^{91 &}quot;Salary Benchmarking Overview, Google's Compensation Philosophy & Deep Dive into Benchmarking," Google, April 2009, (Exhibit B to the Wagner Declaration), GOOG-HIGH TECH-00302552.000011 in GOOG-HIGH TECH-00302552.000001 – 13 and Wagner Declaration, ¶ 15.

⁹² Dr. Leamer's Google compensation data.

- 44. **Exhibit III.21** presents Google's average cash bonus per employee by year, which generally increased over the relevant period. Similarly, **Exhibit III.22** shows average cash compensation to Google's Class members generally trending upward throughout the relevant period.
- 45. Effective January 1, 2011, Google implemented a program referred to as the "Big Bang," which entailed large cash compensation increases for all employees. Google began benchmarking its employee cash compensation to the percentile of the market values, as indicated by market surveys. The company also implemented a one-time, 10 percent salary increase for all employees, which is reflected in **Exhibit III.20**. In addition, as a result of Google's change to the bonus and total cash compensation increased.

(Wagner Declaration, $\P\P$ 17 – 23.)

⁹⁴ Wagner Declaration, ¶¶ 19-20.

(See Google Rewarding Talent: Compensation, slide 27 notes and Katie Temple and Krystal Cope, "Preliminary 2010 Cash Incentive Plan Funding," January 12, 2011, 76616DOC005995 in 76616DOC005993 – 6000.)

95 In 2011, (Wagner Declaration, ¶ 33.)

⁹⁶ Google Rewarding Talent: Compensation, slide 22. A document from 2007 states that bonuses will be paid "typically in late February or early March." (Google's Hiring Policies and Protocols, GOOG-HIGH TECH-0023553.)

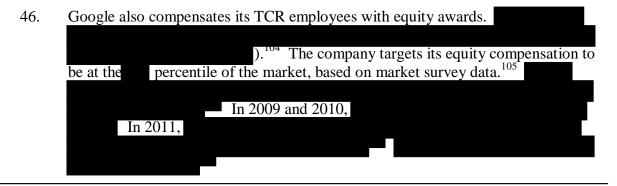

⁹⁷ It is my understanding that the Big Bang was a shift in the mix of compensation away from equity and contingent bonuses toward higher base salaries. See 2011 Compensation Staffing Training, Google, November 2010 ("Google 2011 Compensation Staffing Training"), GOOG-HIGH-TECH-00195512, slides 6 − 7 and Wagner Declaration, ¶ 32 − 3. See Wagner Deposition, pp. 212 − 3. ("Q. And was Project Big Bang what we were talking about earlier, the project that changed Google from having one compensation philosophy to another one? A. Yes, it is the project that increased our competitive targeting for salary compensation and total cash compensation as well as the move to a more fixed from a more variable pay.")

⁹⁸ Wagner Deposition, p. 40.

⁹⁹ Wagner Declaration, ¶ 33.

¹⁰⁰ Wagner Declaration, ¶ 33.

The Big Bang was implemented in response to employee feedback from surveys in 2008 and 2010 finding that employees placed greater relative value on base salary compared to bonus and equity. By responding to its employees' preferences to shift compensation from equity to base salary, Google hoped to reduce attrition to start-up competitors such as Facebook, Twitter, and Groupon. 103

(Google 2011 Compensation Staffing Training slide 7.)

Google 2011 Compensation Staffing Training, slides 6 – 7 and 24 and Wagner Declaration, ¶¶ 32 – 3. ("

Google decided to raise all employee salaries by 10% effective January 1, 2011.")

 103 Wagner Declaration, \P 33 and Competing with Startups: Facebook Case Study, January 10, 2010, GOOG-HIGH-TECH-00450451 – 5.

(Wagner Declaration ¶ 25.)

(Google Rewarding Talent: Compensation, slides 30 and 42 and Wagner Declaration, ¶ 22.)

Wagner Declaration, ¶ 26. ("Target equity has been targeted at the percentile of the market; in other words, Google employees receive equity amounts that are greater than wagner Deposition, p. 167. A 2005 document states that "[w]e've deliberately created a program where the average grant value is competitive "(Google's Hiring Policies and Protocols, GOOG-HIGH TECH-00023559.)

¹⁰⁶ Wagner Declaration, ¶ 25. All worldwide Google employees are eligible for consideration, so long as they meet the criteria of "consistently exceeding expectations [emphasis not included] and have been with Google for at least a year." Google's Executive Management Group (EMG) decides which employees receive refresher grants. (Google's Hiring Policies and Protocols, GOOG-HIGH TECH-0023558.)

^{101 &}quot;Project Big Bang, Revised Comp Proposal," Google, September 7, 2010, GOOG-HIGH-TECH-00194962.pptx, slide 1 and "2010 Bonus Cycle, Manager Training," Google, GOOG-HIGH-TECH-00057190.pptx, slide 10.

¹⁰⁷ Wagner Declaration, ¶ 25.

¹⁰⁸ Dr. Leamer's Google compensation data. A document regarding Google's hiring policies from 2005 states "we expect grants to occur at the end of August." (Google's Hiring Policies and Protocols, GOOG-HIGH TECH-0023559.)

48. **Exhibit III.23** shows the average value of equity by type per Google TCR employee over the relevant period. **Exhibit III.24** suggests that the volatility of average compensation to Google TCR employees is largely driven by the value of equity grants. The average values of GSUs/RSUs and stock options throughout this period are highly volatile, with movement including a large increase in 2007 preceded and followed by years of decreases, including a decrease in 2006 that is the source of a decrease in average total compensation in that year. Average equity values also decreased in 2008 coinciding with a drop in RSU fair value price from \$619 in 2007 to \$473 in 2008.¹¹¹

4. Intel

a. Compensation Overview

49. Between 2001 and 2011, the size of Intel's TCR workforce, the largest of all the Defendants, expanded and contracted by thousands of employees, as shown by **Exhibit III.25**. Major changes to the number of Intel's TCR employees are a result of the dot-com collapse in the early 2000s, a reorganization that added 4,000 TCR employees in 2005, a hiring freeze and layoffs in 2006, and the acquisitions of McAfee and Infineon in 2011. 112

See also Email Exchange re: Proposed Google response to increasing talent pressure, GOOG-HIGH-TECH-00519071.R. (*

6. Lucasfilm

a. Compensation Overview

- 68. The total number of TCR employees employed by Lucasfilm increased more than 6-fold between 2001 and 2011, as shown by **Exhibit III.41**.
- 69. The growth in Lucasfilm's TCR workforce is mirrored by a growth in its total expenditure on TCR employee compensation, as shown by **Exhibit III.42**. **Exhibit III.43** shows that average compensation per TCR employee also tended to increase over the period of study. During the relevant period, the average compensation of TCR employees increased by almost 75 percent. Between 2005 and 2007, the average compensation per TCR employee decreased slightly concurrent with a general change in Lucasfilm's compensation practices discussed further below.

b. Compensation Components

- 70. Lucasfilm's total TCR employee compensation is composed of base salary and an annual bonus. 148 Lucasfilm is a privately held company and thus does not offer equity awards. 149
- 71. Lucasfilm benchmarks against external compensation survey data, including Radford, Croner Animation and Visual Effects, and Croner Software Games, to set compensation at the market median for cash compensation. Lucasfilm is

¹⁴⁴ Under the 1993 and 2002 Equity Incentive Plans, Intuit granted equity in the form of stock options, restricted stock awards, and stock bonuses. (See Intuit Inc., Form 10-K for the period ending July 31, 2002, p. 83.)

¹⁴⁵ Under the 2005 Equity Incentive Plan, Intuit granted equity in the form of stock options, restricted stock awards, stock bonuses, and restricted stock units. (See Intuit Inc., Form 10-K for the period ending July 31, 2005, p. 90.)

¹⁴⁶ See Exhibits III.35 – III.40.

¹⁵⁰ Maupin Declaration, ¶¶ 10 and 13.

separated into five distinct divisions, each with its own set of peer companies to which it benchmarks salary. Prior to 2006, every position at Lucasfilm had its own pay range. In 2006 and 2007, Lucasfilm reviewed its compensation practices and implemented an overarching system of salary ranges to be used across the firm. Since this development,

in an effort to retain key employees due to heavy recruiting from Electronic Arts, Inc. 154

- 72. Base salary increases are determined by employee performance, the overall financial performance of the company, and business unit budget. Increases are effective in April. Exhibit III.44 shows the average base salary per TCR employee between 2001 and 2011, which generally increased throughout the period.
- 73. Bonus payouts are determined by employee performance level, employee performance relative to others, and the performance of their business unit. Bonus payouts occur annually in April, although employees are not guaranteed to receive a bonus every year. Exhibit III.45 shows the average cash bonus per TCR employee between 2001 and 2011.

7. Pixar

a. Compensation Overview

74. Between 2001 and 2011, Pixar's TCR workforce doubled in size as shown by **Exhibit III.46.** In 2006, Pixar was acquired by The Walt Disney Company ("TWDC"). 159

¹⁵⁹ Declaration of Lori McAdams, Vice President of Human Resources and Administration at Pixar, November 12, 2012 ("McAdams Declaration"), ¶ 6.

75. Between 2001 and 2011, Pixar's total compensation to its TCR employees grew along with the number of TCR employees, as seen in **Exhibit III.47**. Pixar's average compensation per TCR Class member shows more volatility. As shown by **Exhibit III.48**, average compensation generally increases between 2001 and 2012 with notable decreases in 2004 and 2008 through 2009.

b. Compensation Components

- 76. Pixar's total TCR employee compensation is composed of: base salary, a film bonus, and the long-term incentive program ("LTI"), which was equity-based until 2009 when it was converted to be cash-based. Prior to this change, Pixar offered equity in both stock options and RSUs. 161
- Pixar uses the Radford survey and the Croner Animation and Visual Effects survey to benchmark base salary.

 Base salary increases are determined based on employee performance as well as performance relative to other employees.

 Increases are announced in late February or early March but are effective retroactively to January 1.

 As shown by Exhibit III.49, average base salary per TCR employee shows a slight increase over time throughout the relevant period.
- 78. Pixar awards a film bonus to its TCR employees based on a film's profitability, and the payout amount is set as a percentage of the employee's salary. ¹⁶⁶ Payments occur approximately four weeks after a film's DVD release, which is typically around five months after the film's theatrical release. ¹⁶⁷ In May 2003, Pixar released *Finding Nemo*, one of the highest grossing animated feature films of all time, and thus, employees received a large film bonus in 2003. ¹⁶⁸ The next Pixar film was not released until November 2004; therefore, employees did not receive a

film bonus in 2004. Since 2006, films have been released during the summer of each year, and thus, film bonuses have been awarded at the end of every calendar year. 170

79. Beginning in 2009, Pixar TCR employees received another form of cash compensation. A few years after its acquisition by TWDC, the LTI program was converted into a cash-based program from an equity-based program.¹⁷¹

Exhibit III.50 shows the average cash bonus to TCR employees at Pixar. ¹⁷⁴ **Exhibit III.51** shows Pixar's average cash compensation per TCR employee by year.

80. Between April 2004 and December 2008 before the change to the LTI program, Pixar awarded equity annually. The Exhibit III.52 shows the average value of equity awards by type to Pixar TCR employees while Exhibit III.53 shows the average value of equity of all types.

8. There Is No Pattern in Compensation Changes Across Defendants When The Class Period Is Compared to The Rest of the Period

81. The charts described above show that there is no apparent pattern of reductions in employee compensation concurrent with Class period. **Exhibit III.54** summarizes average TCR employee compensation by year and Defendant. **Exhibit III.55**

¹⁷¹ McAdams Declaration, ¶ 17.

¹⁷⁷ A New LTI Compensation Plan, slide 2.

shows the percentage changes in the average employee compensation in each year of the relevant period.¹⁷⁸ As can be seen from the exhibit, there is no pattern of large negative changes in compensation at the start of the alleged Class period across all Defendants. Defendants' data also show different patterns with respect to the recession at the end of the Class period, from steady growth at Intel, to flat growth at Adobe, to large swings in compensation at Apple and Google.

- Exhibits III.54 and III.55 also illustrate the high degree of variation in outcomes 82. across the seven Defendant companies. For example, as shown in Exhibit III.55, the average change in compensation from 2003 to 2004, the last year prior to the Class period, ranged from -20.5 percent for Pixar to to 2011, the first year after the Class period, the range is from -1.7 percent for Google to 21.9 percent for Apple. The changes in average TCR employee compensation outside the Class period do not appear to have any pattern that is different from inside the Class period. Dr. Leamer's theory suggests compensation was suppressed during the Class period; however, the Defendants' compensation data do not support this theory. For example, five of the seven Defendants had (Adobe, Apple, Google, Lucasfilm and Pixar). As shown by **Exhibit III.55**, over the period from 2002 to 2011, Adobe, Apple, Lucasfilm, and Pixar all had the , and Intel and Intuit had years that were within 0.2 percent of the highest increases. While, Google's best year was 2003, a percent increase, the increases for Google Class members for 2007 and $\overline{2009}$ were higher than any other Defendant's increases in any year, inside or outside the Class period.
- 83. In his October 2012 Report, Dr. Leamer presented a "preliminary informal impact assessment" that concluded that "under-compensation cumulates to 12.9 percent in 2009." In this informal impact assessment Dr. Leamer averaged the average percent change in total compensation in 2004 and 2011 and used that as a benchmark for what a reasonable compensation growth allegedly should have been during the period 2005 to 2007. Dr. Leamer used this assessment to motivate his conduct regression and to corroborate its purported findings of undercompensation by all Defendants during the Class period. However, by aggregating all of Defendants' compensation changes into one number that reflects the average across Defendants in any given year Dr. Leamer's informal impact assessment hides the

Exhibit III.55 is a disaggregation of Dr. Leamer's Figure 19 from his October 2012 report. We have changed his calculation of the year to year change in compensation. Dr. Leamer calculates the percent change by taking the difference in the log of total compensation. This is not typically how percent changes are calculated. I have used the more traditional approach of taking the difference in compensation and dividing by the first year's compensation. Appendix Exhibit III.1 shows the percent changes using Dr. Leamer's methodology.

¹⁷⁹ Leamer October 2012 Report, pp. 63 – 64 and 140.

¹⁸⁰ As I discuss later, he acknowledges that the recession makes this benchmark inappropriate for 2008 and 2009.

HIGHLY CONFIDENTIAL – ATTORNEYS' EYES ONLY Dr. Leamer's Theory of Compensation Suppression Does Not Support Plaintiffs'

Claim of Class-wide Damages

wide variation in compensation changes across Defendants discussed above. Because of this wide variation in the underlying data, the assessment he performed in his 2012 report actually provides no motivation for the damages method he uses in his current report and produces an unreliable benchmark against which to "validate" his regression results. Viewed company by company, a preliminary assessment like the one performed by Dr. Leamer does not support a conclusion that damages are Class-wide, consistent across any company, or that they should average 10 percent of compensation for all companies across the Class period.

IV. Dr. Leamer's Theory of Compensation Suppression Does Not Support Plaintiffs' Claim of Class-wide Damages

A. Plaintiffs Theory of Widespread Harm from the DNCC Agreements Is Implausible

- 84. Dr. Leamer proposes a theory in which small decreases in cold calling caused large suppression of wages across the more than 60,000 diverse members of the Class. His theory of impact and damages rests on three key assumptions. First, Dr. Leamer posits that the DNCC agreements restrained material information about the market value of Class members' labor. He asserts that cold calling "reveals the nature of outside opportunities both to workers and to employers," and that the DNCC agreements "suppress compensation by limiting this flow of information about attractive outside opportunities." Dr. Leamer acknowledged in deposition that he had not studied whether his assumptions are correct, and he has made no attempt to measure them. 182
- 85. Second, Dr. Leamer claims that in the absence of the agreements, recipients would have used the information obtained from cold calls from Defendant firms to bid up compensation at their current employer or leave for new jobs at other firms. For

¹⁸¹ Leamer October 2012 Report, ¶ 68. See also Leamer December 2012 Reply Report ¶ 12. ("Cold-calling is a distinct and special channel of information that accesses job candidates who otherwise would be left unaware of attractive opportunities.")

Without data on cold-calling, Dr. Leamer acknowledges that he cannot directly measure the information associated with cold calls and how much actual information was suppressed. Leamer Deposition Vol. I., p. 80. ("Q. How much information was suppressed between Apple and Adobe? A. Well, that would require a data set that I don't have-- I don't have the information on all the cold calling that was made and all the cold calling that was not made as a consequence of the agreement. And secondly, to translate that into some measure of information is going to be very difficult. ... And I haven't had a database that would allow me to do it.") Leamer Deposition Vol. I., pp. 101 – 2. ("Q. ... how long would the process take in order to have some kind of impact? A. ...early on I was imagining that we would have career paths of each individual and information about who was cold called when, and you can build up a ... econometric model that would underline the sequence of questions that you'd ask. But because we don't have that information, we have to do with what we have.") Leamer Deposition Vol. III., p. 921 – 2. ("Q. Have you studied that with regard to the defendants, how information was shared among the defendants' employees? A. Well, I've taken it as a given that there would be some significant information sharing among employees... Q. But you have no evidence of the rate or amount of information sharing among any employee force at any of the defendants, do you? A. I don't have direct evidence.")

- example, Dr. Leamer writes, "when employees discover information regarding their labor's value by receiving an offer from a competing employer, those employees use that information to negotiate higher salaries at their current employer." Dr. Leamer further assumes that "those individuals tell others at their employer, who then resent the perceived unfair jump in pay, increasing pressure to match compensation increases broadly." 184
- 86. Finally, Dr. Leamer argues that the impact of individual compensation increases or employee departures would have propagated through Defendants' alleged somewhat rigid wage structures as employers preemptively increased wages across all job categories within the Class. He assumes that "when management becomes aware of an attractive outside opportunity for one individual this may make management aware also of the implicit competitive threat to similar individuals and management may feel it wise to make a preemptive move against that threat by an increase in compensation for these newly-threatened similar employees." 185
- 87. Plaintiffs' theory of harm does not support the measure of Class-wide damages that Dr. Leamer claims. The amount of information allegedly restricted through DNCC agreements was only one of potentially many sources of "price discovery" information available to employees from both Defendants and non-Defendants. Because employees continued to have access to information about outside opportunities and their market worth from many other sources, preemptive raises or anticipatory increases in compensation would still have occurred during the Class period. If one accepts Plaintiffs' assumption that internal equity concerns drive compensation decisions these compensation increases would have been propagated throughout the Class.
- 88. At most, restrictions on cold-calling may have had the effect of reducing information to specific employees about specific opportunities at specific firms. The impact to an individual who might have received such calls, if any, would depend on the nature of the foregone opportunity and the potential increase in compensation afforded by the opportunity. But there is no basis to believe that those restrictions would have caused impact to all or substantially all Class members.

¹⁸³ Leamer October 2012 Report, ¶ 113.

¹⁸⁴ Leamer October 2012 Report, ¶ 114 (internal quotations omitted.) He characterizes this as "water-cooler talk." (Leamer October 2012 Report, ¶ 75.) Plaintiffs have not identified an actual instance of this chain of events occurring, and none of the five named Plaintiffs experienced this alleged chain of events.

¹⁸⁵ Leamer May 2013 Supplemental Report, ¶ 15.

B. Restrictions on Cold Calling Among Defendant Firms Would Not Have Led to Widespread Compensation Changes

- 89. There are a number of significant flaws in Dr. Leamer's chain of reasoning regarding the method by which a reduction in cold calling can suppress wages on a Class-wide basis. In the first instance, there is no basis for Dr. Leamer to assume that cold calling reveals positive information about outside opportunities. Nor is there any basis for Dr. Leamer's assumption that the information available to a firm's employees would be materially diminished by a reduction of cold calling from one, two, or three firms that together make up a tiny fraction of potential hiring demand for those employees.
- 90. Many cold calls may not reveal any information to a prospective target. Employees may not respond to cold calls or follow up on unsolicited emails. Some of the named Plaintiffs testified that they frequently blocked or ignored unsolicited calls or emails from recruiters. If the recipient is a "passive" candidate, no material information may have been transmitted to the call recipient since, as Dr. Leamer points out, these employees are "content and not actively looking for opportunities elsewhere." I87
- 91. Even if some interest is shown by the candidate in following up with the recruiter, the end result of that interaction need not result in the employee learning positive information about job opportunities. It may be that the opportunity available offers a lower compensation package than the employee is currently earning. For example, average compensation at Google was among the highest of all the Defendants during the Class period. **Exhibit III.54** shows the average compensation per TCR employee at all Defendants in all years. Google had the highest average TCR employee compensation in every year of the Class period except 2008, when average compensation at Apple exceeded that of Google by just over \$5,000. In several of the alleged damage years, Google's average compensation was more than double the average compensation of some of its alleged rival employers. In 2005, for example, average compensation at Google was more than twice average compensation of TCR employees at Apple, Intel and Intuit, which were the only firms with which Google had a DNCC agreement. It is simply implausible that

NERA Economic Consulting 34

-

Deposition of Siddharth Hariharan, former software engineer at Lucasfilm, Volume I, October 12, 2012, p. 44. ("I just know that I received many [cold calls] and continue to receive many from people that I've told not to....") See also Deposition of Daniel Stover, a former software engineer at Intuit, Volume I, October 29, 2012, pp. 201 – 2. ("Q. With respect to the phone calls, did you make any efforts to screen the calls so you didn't have to pick it up and—A. No desire at all to talk to him. ... It doesn't really show a lot of effort in terms of myself, it's just kind of a random screening.") In the Deposition of Mark Fichtner, he discusses the difference between "serious cold calls" and "spam cold calls." (Deposition of Mark Fichtner, a former software engineer at Intel, Volume I, October 15, 2012, pp. 88 – 90.)

¹⁸⁷ Leamer October 2012 Report, ¶ 62 and "Intro to External Sourcing, Target Audience: Intel Sourcers, Q1 2009," Intel, 2009, 76550DOC000024 in 76650DOC000014 – 95.

Google would have been at risk of losing sufficient numbers of its employees to firms with which it has a DNCC agreement or that it would have had to raise compensation to all of its TCR employees to prevent attrition to firms with substantially lower wage structures.

- 92. Finally, even if an employee would have received a cold call, obtained information about a better job opportunity at one of the DNCC Defendants, and received an offer, that would not necessarily cause any effect on compensation at the employee's current firm. The current firm may decide not to make a counteroffer, in which case the employee remains at his or her current compensation level or leaves for the new opportunity. The current employer would elect to make a counteroffer only if the value of the employee that was a recipient of the call exceeded the required compensation to keep the employee.
- 93. Moreover, Google did not have DNCC agreements with Adobe, Lucasfilm or Pixar. There is no reason why the DNCC agreements entered into between these other firms would have affected compensation to Google's TCR employees. To the contrary, if recruiters at other firms are restricted from calling some Defendants, but not Google, then one might reasonably expect that cold calls from those firms to Google Class members, to the extent there were any at all, would go up during the Class period. Therefore, not only would Google's own DNCC agreements not reasonably have saved Google from having to raise its compensation structure even further above that of its alleged rivals, the DNCC agreements between other firms could have caused an increase in cold calls to Google that could potentially offset any alleged reduction in calls from Apple, Intuit, and Intel. This is also true for the other Defendants. No Defendant had DNCC agreements with more than three other Defendants. Therefore, each Defendant could have experienced an increase in cold calls from the Defendants with which it did not have any agreement.
- 94. Plaintiffs have made no showing and it is implausible to assume that absent the DNCC agreements, any Defendant would have faced such aggressive cold calling that it would have been compelled to make reactive or preemptive increases in its compensation for all or substantially all its employees. Dr. Leamer has not established that the compensation structures of any of the firms in his damage study

Dr. Leamer acknowledged that there is a "presumption" that Defendants would increase cold calling to Defendants with which they do not have an agreement. Leamer Deposition Vol. III., p. 1085. ("Q. So do you have any opinion at all as to whether Apple's inability to place cold-calls to Adobe employees would increase the likelihood that it would call Intel employees?
A. Well, this comes back to the substitution possibility, and the presumption would be that there would be some substitution.
Q. The presumption would be that if Apple can't call Adobe employees, it's more likely to call Intel employees; correct? A. Correct.")

were below market. As stated above Adobe, Apple, and Google targeted their salary structures to be above market levels. 189

C. Employees Do Not Depend on Cold Calling From DNCC Defendants to Learn About Their Market Worth

- 95. Plaintiffs' overarching theory of harm is that cold-calling contributes to the flow of information about outside opportunities available to employees and the employees' market worth. Under Plaintiffs' theory, when employees have ready-access to information about their market worth, firms must pay employees their market wage or risk losing them to another firm that is willing to offer that employee higher compensation or an otherwise better opportunity. According to this theory, the greater the flow of information to employees, the more closely aligned compensation must be to market wages. Thus, according to Plaintiffs' theory, restricting cold-calling has the potential to restrict information flow and allow firms to undercompensate employees with less fear of losing them to an outside opportunity.
- 96. Dr. Leamer alleges but does not establish through factual evidence that cold calling from the DNCC agreement firms was an important source of information about the market worth of Defendants' TCR employees. Dr. Leamer offers no evidence that cold calling from Defendant firms during the relevant period would have provided information not otherwise available in the market. There are many other available sources of information about jobs and wages. Defendants' TCR employees can discover information about market wages and opportunities from new hires joining a Defendant firm from the market, cold-calling from non-Defendant firms, cold calling from Defendant firms that did not enter into DNCC agreements with the employee's firm, and even hires from the DNCC agreement firms that continued in the Class period notwithstanding the agreements. In addition, Defendants' TCR employees can discover information from job postings, salary surveys, job fairs, websites such as monster.com that post compensation information, and information from acquaintances at other firms.

¹⁸⁹ See Background Sections for Adobe, Apple, and Google (III.A.1.b, III.A.2.b, and III.A.3.b.) Adobe began targeting above the market for its base salary in 2008, Apple above market in 2006 and Google was at or above market prior to 2007, and then further increased its target in 2007. Intel was targeting below market average at the beginning of the Class period and then raised its target to above average in 2006. (See section III.A.4.b and McKell Declaration, ¶ 15.)

¹⁹⁰ Dr. Leamer acknowledges that there is no way to measure exactly how much cold calling was used to recruit and how many people benefited from information from cold calling in non-Class periods. Furthermore, he does not provide reliable evidence that the ripple effect would have been widespread throughout the Class. (See Section IV.E.2 for additional discussion regarding Dr. Leamer's ripple effect analyses.)

¹⁹¹ For examples, see Murphy January 2013 Report, ¶¶ 21 and 39 and Deposition of Donna Morris, Senior Vice President of Global Human Resources at Adobe, August 21, 2012 ("D. Morris Deposition"), pp. 90 – 1. ("Q: And its one of the ways in which information about available jobs is transmitted to employees? Is that right? Cold calling is. A:...I would say earlier in

- 97. As Dr. Leamer acknowledged in deposition, the own-hiring that a firm does provides a potentially significant source of information for the Defendants' incumbent employees. Having gone through the job market to reach their employer, a new hire would have relevant information about the current value of a job, and other potential opportunities. The "water cooler talk" that Dr. Leamer describes as the method for transmitting cold call information could just as easily be applied to recent hires talking to their new colleagues. Between 2005 and 2009, Defendant firms hired 20,054 new TCR employees. While Dr. Leamer states that new employees' starting salaries would also be affected by the DNCC agreements, he has no evidence or analysis to support that opinion. Dr. Leamer's own regression analysis only uses compensation information for TCR employees who have been at a Defendant firm for at least two years. Therefore new employees are entirely omitted from his compensation analysis.
- 98. In fact, some of these new hires from non-Defendant firms could have been recruited by other Defendant firms in addition to the firm they joined. Prior to the new hire joining a Defendant firm, there is no restriction on the recruiting methods other Defendants could use to attract that employee. Exhibit IV.1 shows that Defendants hire new employees from a wide variety of sources. 195 Google drew new employees from over 8,500 sources. Only Lucasfilm and Pixar drew new employees from fewer than 2,000 sources. Nonetheless, there are some firms from which all Defendant firms tend to recruit. So, for example, a person working for Microsoft may be simultaneously recruited by Apple, Adobe, Lucasfilm, and Google. If the employee eventually chose to join, say Apple, the wage that Apple offered that employee must have been sufficient to compete with Adobe, Lucasfilm, and Google, regardless of any DNCC agreements between those firms. And, if firms have the somewhat rigid compensation structure that Dr. Leamer claims they have, then the competitive wage that Apple would have had to pay the Microsoft employee, would have a ripple effect through Apple, notwithstanding the DNCC agreements.
- 99. Even if cold calling represents some unique form of information that is different from the information newly hired employees bring in from the outside, the potential information flow from cold calling did not cease during the Class period. The

a person's career they would likely find out more about job opportunities through their friends, job postings, different websites, sites like Glassdoor, et cetera.")

¹⁹² Leamer Deposition Vol. I, p. 79. (Q: "And there was information flow and price discovery resulting from all of those hires and losses, correct?" A: "That's correct.")

¹⁹³ Leamer October 2012 Report, ¶ 75.

¹⁹⁴ See Exhibit IV.3.

¹⁹⁵ **Exhibit IV.1** is derived from recruiting data from each Defendant. I am not able to identify whether the employee was in the Class for any of the Defendants except Adobe and Apple.

Case 5:11-cv-02509-LHK Document 863 Filed 04/14/14 Page 42 of 426

HIGHLY CONFIDENTIAL – ATTORNEYS' EYES ONLY Dr. Leamer's Theory of Compensation Suppression Does Not Support Plaintiffs'

Claim of Class-wide Damages

DNCC agreements would not have affected cold-calling from the hundreds of other employers looking to hire Defendants' employees. As Dr. Leamer acknowledged in deposition, the majority of the firms with which the Defendants compete for recruits are non-Defendant firms. ¹⁹⁶

100. Furthermore, the DNCC agreements did not prevent the Defendants from cold calling employees from other Defendants during the Class period. 197 As described above and acknowledged by Dr. Leamer, if a DNCC agreement prevented a Defendant from cold calling one of the other Defendants, the firm could substitute by cold calling the other Defendants' employees more than it would have without the agreement. The table below shows that during the Class period, the DNCC agreements challenged by Plaintiffs represented only six of the 21 possible pairs of Defendants.

Leamer Deposition Vol. I., p. 79. ("Q: So let me ask you to look at the data you do have that you cited in your own report. And, once again, the number of talent acquired and talent lost, the vast majority comes from nondefendants, correct?...A: The majority definitely does.") Leamer Deposition Vol. III., p. 903. ("Q. Are you aware of the evidence in this case that shows that for each defendant, 99 percent of the employees that were hired before, during, and after the conduct period came from sources other than the defendants? A. Well, I know the number is very large...I would stipulate that indeed that is the case."). See also "DRAFT: Executive Search," Jeff Vijungo, Senior Director, Talent Acquisition, at Adobe Systems, Inc., 2008, ADOBE_005966 in ADOBE_005950 – 67.

¹⁹⁷ Dr. Leamer acknowledged at deposition that there were no restrictions on cold-calling among many of the Defendants. Leamer Deposition Vol. III., p. 894. ("Q. And in fact, there is no restriction on cold-calling among many of the defendants with each other; correct? A. That's correct.")

Dr. Leamer acknowledged that there is a "presumption" that Defendants would increase cold calling to Defendants with which they do not have an agreement. Leamer Deposition Vol. III., p. 1085. ("Q. So do you have any opinion at all as to whether Apple's inability to place cold-calls to Adobe employees would increase the likelihood that it would call Intel employees? A. Well, this comes back to the substitution possibility, and the presumption would be that there would be some substitution. Q. The presumption would be that if Adobe can't call Intel employees, it's more likely to call Intel employees; correct? A. Correct.")

Table 1

DNCC Agreements Between Defendants

	Adobe	Apple	Google	Intel	Intuit	Lucasfilm	Pixar

- 101. Moreover, notwithstanding the restriction on cold calling, the DNCC agreements did not prevent recruiting and hiring between Defendants who were parties to those agreements. Defendants recruit using a variety of tools and sources so a restriction on cold calling during the Class period would have likely resulted in substitution to another recruitment method. Exhibit IV.2 shows hiring from DNCC agreement partners, while small even prior to the DNCC period, did not decrease during the Class period relative to the pre-Class period and was only 0.2 percentage points lower than in the post-Class period. The continued hiring by Defendants of employees from firms with which they had DNCC agreements shows that recruiters found alternative ways of reaching TCR employees or employees continued to find ways to become informed about opportunities at DNCC firms.
- 102. Because TCR employee transfers did not meaningfully drop between the firms with DNCC agreements, there is no basis to assume that the flow of information about positive opportunities at these firms was meaningfully suppressed. Moreover, because actual cross-hiring did not decrease, the do-not-hire without approval conditions Dr. Leamer points to do not appear to have had any impact on hiring.²⁰⁰

Leamer Deposition Vol. III., p. 903. ("Q. ...So you would agree with me that recruiters, whether they're employed by the defendant or they're outside contractors, have incentives to find other means to successfully recruit candidates if they can't do cold-calling? A. That's correct.")

²⁰⁰ Leamer October 2012 Report, ¶¶ 44 and 49 and **Exhibit IV.2**.

D. Evidence Points to Little Loss of Information, If Any, Due to the Agreements at Issue

- 103. The amount of information that might reasonably have been restricted by DNCC agreements is small relative to the potential other sources of information described above. Transfers between firms with DNCC agreements represented only 0.2 percent of new hires even before the Class period. See **Exhibit IV.2**. In contrast, hiring from sources with which there is no DNCC agreement makes up the remaining 99.8 percent of hiring. Dr. Leamer overlooks these meaningful alternative sources of information that could have (1) informed Defendants' TCR employees when there were better opportunities with other firms or that their compensation was too low and (2) informed Defendants that compensation increases were necessary for their incumbent employees, if in fact either of these things is true.
- 104. **Exhibit IV.2** also shows that in terms of both the counts and percentages, the amount of hiring from Defendant firms, while small even before the alleged Class period, did not decrease during the Class period.²⁰¹ These figures suggest that the overall amount of recruiting between Defendant firms did not decrease despite the agreements not to cold call between certain pairs of Defendants.
- 105. **Exhibit IV.3** shows that between 2001 and 2011, the Defendants hired a substantial number of TCR employees in every year. During the alleged Class period in particular, new employees represented 8.6 percent of the Defendant firms' total TCR employees. Relative to the pre-Class period, the level of hiring from 2005 to 2008 increased at almost all of the Defendants. In particular, Apple and Google increased their number of TCR employees during the Class period, and so their hiring was higher than in the pre-Class period. After a jump in hiring in 2005, Intel carried out a reduction in force, yet it still had a greater number of new hires than most of the other Defendants during the Class period. Because overall hiring of TCR employees did not decrease at the Defendant firms and new hires are

²⁰¹ For this analysis, new hires are counted only when they are first hired by any of the Defendants. Rehires are not included.

New hires are employees hired from the labor market and do not include employees that joined when their firm was acquired by a Defendant firm. The latter have compensation determined at their prior employer and, therefore, could inform the Defendants' employees of what a competitor pays its employees. But Dr. Leamer does not include employees that joined through an acquisition in his count of new hires so for consistency I have left them out of mine. Unlike, Exhibit IV.2, for the analysis in Exhibit IV.3 I include rehires in the count of total new hires.

²⁰³ This figure is based on Dr. Leamer's regression and employee data, using his n_new_hire and the sum of the n_emp_yr variables to calculate the percentage of new employees at all Defendant firms as a portion of the total number of employees at the Defendant firms between 2005 and 2009.

²⁰⁴ See also, **Exhibits III.9** and **III.17** above. Note that these charts include both new hires and acquisitions.

²⁰⁵ As described above, Intel began a reduction in force in 2006, laying off 10,500 employees and implementing a hiring freeze, as a result of a company restructuring effort.

- a substantial share of each firm's employee base, information about market compensation levels would still flow to TCR employees during the Class period. Thus, there is no basis to assume that the amount of information available to the Class was lessened in the Class period.
- 106. **Exhibit IV.4** shows the percent of each Defendant's TCR employees that were new hires during the pre-Class, Class, and post-Class periods. The percent of new hires during the Class period was higher for all of the Defendants relative to at least one non-Class period. This is further evidence that the amount of information the Defendants' incumbent TCR employees received about their worth was not lower during the Class period.
- 107. **Exhibit IV.5** shows this information from the perspective of the Defendant who lost employees to a DNCC agreement partner. **Exhibit IV.5** shows the number and percent of each Defendants' TCR employees who were recruited to a firm with which it had a DNCC agreement. For example, in the pre-Class period, Adobe lost 11 employees to Apple (the only Defendant firm with which it had a DNCC agreement), but it lost 26 employees to Apple during the Class period. While the 11 employees lost in the pre-Class period represented 0.15 percent of Adobe's TCR employees, the 26 employees lost to Apple during the Class period were 0.26 percent of Adobe employees.
- 108. The analysis in **Exhibit IV.5** shows that the number of employees lost to DNCC agreement firms in the pre-Class period was very small. No Defendant lost more than 0.2 percent of its TCR employees to a DNCC firm. With the exception of Intuit, during the Class period, hiring of Defendants' TCR employees by firms with DNCC agreements did not decrease relative to the pre-Class period. This suggests that the DNCC agreements did not stop Class members from finding out about opportunities at other Defendant companies. This further undermines Plaintiffs' claim that the DNCC agreements caused employees to lose information about job opportunities and their market worth. More TCR employees left during the Class period than in the pre-Class period. Thus, information about opportunities was still reaching Defendants' TCR employees notwithstanding the DNCC agreements.
- E. Dr. Leamer's Theory that Employers Failed to Make Preemptive Increases in Compensation to Employees Because of the Conduct at Issue is Implausible
- 1. Defendants Continued to Increase Compensation in the Class Period Based on Other Sources of Market Information
 - 109. When Dr. Leamer alleges that the suppression of the flow of information on market worth by Defendants' DNCC agreements resulted in a suppression of compensation increases to the entire Class, he overlooks the fact that the material information that he claims was less available to Class members was still collected and utilized by the Defendants to increase compensation to the Class. Dr. Leamer's suggestion that

there would have been still more increases is speculative and implausible. Evidence produced in this case demonstrates that the Defendants responded to information on competitive wages from a variety of sources and maintained compensation structures that were competitive in a broader market.

- 110. As described in the background section, throughout the period of study (including in the alleged Class period) the Defendants used market compensation surveys as a benchmark for their compensation structure. These surveys compile relevant compensation information from the employers each Defendant considered its peers. Each merit cycle, when compensation increases were determined, Defendants used a comparison of their compensation to the market data as part of the decision making process on how much to increase compensation. Thus, the compensation levels of rival employers (most of whom were not Defendants) were already being factored into the Defendant's pay structure. Information from individual TCR employees that would hypothetically have been cold called would not likely provide material new information beyond that which was already collected in the surveys.
- In addition, arms-length negotiations with potential new hires gave employers information about whether their compensation was competitive enough to attract the new employees they needed.
- 112. The Forever Google program is an example of how Google targeted compensation increases to particular employees without, in turn increasing compensation for other

2008, Lucasfilm used the Croner Software Games Survey to benchmark against 37 peer companies including Microsoft Corporation, Disney Interactive Media Group, Disney Interactive Studios, Sony Computer Entertainment America, Inc., and Warner Bros. Interactive Entertainment. ("Croner Software Games Survey Results," The Croner Company, 2008, (Exhibit A to the Maupin Declaration), LUCAS00018799 – 800 in LUCAS00018779 – 807.)

Wagner Declaration, ¶ 9.

See also Google Rewarding Talent: Compensation,

²⁰⁶ The peer companies for each Defendant included some of the other Defendant firms, but the vast majority of peers were not Defendant firms. Many of the Defendants benchmarked against the same peer companies. In 2009, Apple identified 21 peer companies, including Cisco Systems, Inc., Hewlett-Packard Company, International Business Machines, Microsoft Corporation, and Oracle Corporation, and only 2 are Defendants. (Burmeister Declaration, ¶ 4.)

employees.²⁰⁸ As I will discuss in more detail below,

Yet this increase to a select group of employees did not cause a ripple throughout Google's TCR employees. Furthermore, Dr. Leamer has no basis to argue that more people would have been selected for the Forever Google program, since that was determined by Google's business needs, or that these individuals would have received more equity than Google gave them. Finally, I also understand that Google's adoption of Big Bang followed unrelenting recruiting from Facebook and, to a lesser extent, other start-up firms. This activity continued for years and resulted in a significant number of Google employees transferring to other non-Defendant companies. Plaintiffs point to no evidence that additional cold calls from Defendants would have triggered such a broad based response by any other Defendant.

2. Dr. Leamer's Analyses of the Purported Ripple Effect Do Not Demonstrate that Compensation Moves Together Within and Across Defendants' Job Titles

- 113. Dr. Leamer argues that the alleged diminution of cold calls hurts all employees in the Class because of the "somewhat rigid" pay structure of the Defendants. Dr. Leamer argues that the "water-cooler talk" would have led to broad, reactive or preemptive compensation increases that "ripple" through the entire Class. My analyses demonstrate that Dr. Leamer is wrong to conclude that there is a "somewhat rigid" salary structure that leads to widespread undercompensation in the Class period.
- 114. Dr. Leamer relies on several statistical analyses to support his conclusion that the compensation suppression allegedly caused by the DNCC agreements would be broadly felt. In the Leamer October 2012 Report, Dr. Leamer performs what he calls a "Common Factor Analysis" and concludes that he can explain about 90 percent of the variation in compensation by looking at each employee's firm, title

²⁰⁸ As Dr. Leamer acknowledged in deposition, reactive and preemptive wage increases can also occur because the Defendants are facing competition from Defendants with which they do not have an agreement as well as non-Defendant firms. Leamer Deposition Vol. III., p. 906. ("Q. And isn't it true that reactive and preemptive wage increases can occur because Adobe is facing competition for its employees from both non-defendants and defendants other than Apple? A. That's correct.")

and a few individual characteristics: age, tenure, location, and gender. This, he says, is evidence of the somewhat rigid salary structure: if employees at the same firm, of similar ages, and job titles earn similar wages, the firms must have somewhat rigid salary structures. In the Leamer May 2013 Supplemental Report, Dr. Leamer extends his analysis to examine pay structure as it relates to job titles within each company.

- 115. Dr. Leamer's job title pay structure analysis is comprised of two parts. He first analyzes the correlations of total compensation for each job title and reports the correlations between average job title compensation and total Class compensation at each firm. ²¹³ In Figures 2 and 3 of his report, he records how often the correlation coefficients are positive, and in Figures 4 and 5 of his report he notes the percentage that are statistically significant, which can be as low as 54 percent when looking at correlations of changes in compensation and as low as 45 percent when looking at correlations of levels of compensation. ²¹⁴
- 116. Dr. Leamer then performs regression analyses of the average job title compensation to determine whether the positive correlations come from a sharing effect, meaning they are moving together because they are related, or if they are being driven by an outside force that is moving both series, even though the series are not otherwise related. He further attempts to determine whether a firm takes "corrective action" when two job titles begin to move apart. In this analysis Dr. Leamer purports to test the effect of internal equity on the average total compensation within each job title. ²¹⁶
- 117. He opines that this pay structure analysis corroborates his previous analysis and is further evidence of the rigidity of the compensation systems across the Defendant firms.
 - a. Dr. Leamer's Conclusions from his Individual Level Data Analysis are Flawed and Do Not Support a Somewhat Rigid Wage Structure That Would Propagate Compensation Increases
- 118. In his "Common Factors Analysis," Dr. Leamer purports to show that a small number of common factors explain the vast majority of the variation in

²¹³ Learner May 2013 Supplemental Report, \P 30 – 33 and Tables 1 and 2.

²¹⁴ Leamer May 2013 Supplemental Report, ¶¶ 30 – 33 and Figures 2 – 5.

²¹⁵ Leamer May 2013 Supplemental Report, ¶ 26.

²¹⁶ Leamer May 2013 Supplemental Report, ¶ 29.

- compensation and, thus, there is a somewhat rigid salary structure.²¹⁷ But that is not, in fact, what the data show.
- While it is true that his regressions show that the common factors account for most 119. of the variation in an employee's total compensation, the amount of variation explained is not always as high as he implies. For example, the variation explained by his common factors is as low as 52 percent for Pixar in 2003 and 62 percent for Google in 2005. ²¹⁸ In addition, Dr. Leamer overstates the importance of some of the "common factors." The common factors included in Dr. Leamer's common factors regression are the firm, location, job title, age, tenure and gender.²¹⁹ However, employer and job title explain almost all of the variation that Dr. Leamer claims to have explained in his regression analysis. As shown in **Exhibit IV.6**, running the same regressions with only the employer and job title indicator variables explains virtually the same amount of variation in compensation as Dr. Leamer's regressions.²²⁰ Further, excluding job title and employer and only accounting for individual factors, less than 20 percent of the variation in compensation is typically explained. This means that the "common factor" that allegedly explains wage rigidity is job title, however, as shown below, even if employers pay similar salaries for a similar job title, that does not mean that employees are treated similarly over time. Employees can be promoted to different job titles and earn salary increases commensurate with their promotion. This routine and expected event in an employee's career is completely unaccounted for in Dr. Leamer's analysis.
- 120. In addition, while his common factor regressions may suggest that at any given point in time an employee's employer, job title, location, age, tenure, and gender may produce a reasonably accurate estimate of that person's compensation, those factors do not imply that employees are treated in a somewhat rigid manner over time, a key assumption underlying Dr. Leamer's propagation theory. Without showing that the rigidity leads to employees being treated similarly over time, Dr. Leamer is wrong to conclude that internal equity concerns will lead to broad based preemptive compensation adjustments. Dr. Leamer attempts to establish that internal equity concerns cause firms to treat employees similarly over time in the Leamer December 2012 Reply report by demonstrating that the vast majority of employees receive a base salary increase every year. While employees do generally receive raises every year, the data do not support the broader conclusion that the raises given to employees are granted in a somewhat rigid manner over time.

²¹⁷ Dr. Leamer uses the regression R² to measures the amount of variation explained by his "common factors."

²¹⁸ Leamer October 2012 Report, Figure 14.

²¹⁹ Leamer October 2012 Report, Figures 13 and 14.

²²⁰ In each year the R² for the model with only title and firm is within 1 percentage point of the R² using all of Dr. Leamer's common factors.

121.	While similar individuals may start at similar base salary levels, over a period of
	five years, growth levels are very different such that the base salary of those
	individuals may be quite different by the end of the five-year period. Exhibits
	IV.7-IV.10 provide examples illustrating the base salary outcomes of cohorts of
	individuals who started at Defendant firms at roughly the same time. ²²¹ For
	example,

See Exhibit IV.7. This example shows that even when employees start at similar compensation levels, the raises that they earn, which reflect individual performance, can result in very different salary outcomes over five years.

- A similar result is observed when analyzing 34 male Google Class members aged 23-24 with less than two years of experience and the title Software Engineer III. These employees had a range of base salaries from in 2007 (a starting range of 31.9 percent). By the end of 2011, the range had grown to (a range of percent). See Exhibit IV.8. The salaries at the top of this range are almost double the salaries at the bottom of the range. This observed variation in salaries within a job title for employees with similar ages suggests that Google is not confined to a rigid salary structure, and instead can reward employees based on individual characteristics such as performance. It is also worth noting that in this example, even when the employees were all in the same title at the very beginning of their tenure, the range of salaries was large. Analyses of Intel and Adobe employee cohorts (Exhibits IV.9 and 10) demonstrate variation among base salaries that is also indicative of a lack of a rigid pay structure or common movement in base compensation over time.
- 123. As shown in **Exhibits IV.11-14**, extending this analysis to look at total compensation only makes the variation greater. Hence, the common factor analysis presented by Dr. Leamer does not suggest a rigid pay structure over time. Examining individual employees' compensation over time demonstrates the

²²⁵ Total compensation for the Apple cohor	rt shows a		The
Google, Intel, and Adobe cohorts star	t with total compensation	n spreads of percent,	and 57.9 percent,
respectively, in 2007, and increase to	percent,	and 82.1 percent in 201	1.

²²¹ A similar analysis was conducted by Dr. Murphy in his November 2012 report.

²²² The range percentage is measured by the difference in the highest to lowest salary as a proportion of the minimum of the range.

²²³ The employee compensation changes within this cohort of employees because of differences in annual raises and in the timing and number of promotions over the five years.

²²⁴ The analyses in these illustrative exhibits track changes in base salary over time. While base salary is just one of the compensation components earned by the Class, bonus and equity awards demonstrate even greater variability across cohorts of Class members (See below for a discussion of variation in equity payments across Class members.)

- absence of any structure that would cause compensation increases to ripple through a firm's TCR employees because of additional cold calls from one, two, or three potential employers.
- 124. Looking at the actual variation in compensation changes within and across job titles further demonstrates that Dr. Leamer's conclusions are wrong. Exhibit IV.15 shows the wide range of changes in compensation for the employees in each job title. Moreover, there is also wide dispersion in the changes in pay across job title for all Defendants. Exhibit IV.16 shows the percent deviations from the average change in compensation by job title. The range of compensation changes between those with the largest average pay increases, the top decile, and those with the smallest average pay increases, the bottom decile, can be as large as 59 percent. These differences can be caused either by movement across job titles changing the mix of employees being averaged together or by disparate compensation changes within the job title. Both of these reasons are inconsistent with Dr. Leamer's contention that the allegedly rigid compensation structure and internal equity concerns will lead to widespread salary suppression caused by a significant ripple effect on the small number of individuals who may have not received a cold call because of the DNCC agreements.

b. Dr. Leamer's Conclusions from His Analysis of Job-Level Pay Structure and Correlations Are Also Faulty

- 125. In the Leamer May 2013 Supplemental Report, Dr. Leamer extended his common factors analysis to look at movements over time across job title. As described above, he runs correlation analyses and regression analysis on average title compensation and asserts that these models support his opinion of a somewhat rigid compensation structure. Dr. Leamer concludes that because the average total compensation between most job titles is positively correlated there is a somewhat rigid compensation structure. This conclusion is without merit. I will discuss two primary problems with his analyses.²²⁸
- 126. First, even if a firm had a somewhat tight compensation structure within and across job titles and the data here show wide variations within and across job titles –

²²⁶ This analysis includes only employees who were in the same job title the previous year, so that I do not artificially increase the variation due to employees moving between job titles.

²²⁷ This analysis is similar to the analysis shown in Exhibit 6 to the Murphy June 2013 Supplemental Report. The changes hold constant employee age, tenure and gender.

²²⁸ There is a third issue that I mention above: averaging the compensation for each job title and comparing across years creates variation because the mix of employees in each title changes every year. In his third deposition, Dr. Leamer agreed that the change in mix negatively affects his averages. See Leamer Deposition, Vol. III, p. 1077. ("A. Yeah, I'm totally in synch with this idea that changing composition of the workforce raises havoc with the title averages, and I've made that clear in this report, too. So if that's where we're going, I agree.")

individuals move between job titles. The ability of a firm to respond to outside information by moving an employee from one title to another makes Dr. Leamer's analysis irrelevant. Second, correlation analyses simply show the extent to which two series move together, they do not show that one causes the other or that the comovement even leads to similar end points. As I will demonstrate below, the level of correlation that Dr. Leamer finds does not support his opinion that the comovement is particularly rigid. Therefore, the additional analysis performed by Dr. Leamer in the Leamer May Supplemental Report do not support the conclusion that a somewhat rigid compensation structure necessarily leads to preemptive compensation changes across a wide group of employees.

- 127. Dr. Leamer overstates the importance of his correlation analysis. Correlations range from -1 to 1. With a perfectly rigid wage structure, we would expect a correlation close to 1, signaling that an employee's wages always move in the same direction. But even a correlation close to 1 may not be evidence of rigid structure, because correlations say nothing about magnitudes. For example, assume two titles both have starting salaries in 2005 of \$50,000. If over the next five years Job Title 1 has an annual increase of \$1,000 and Job Title 2 has an annual increase of \$10,000, the correlation coefficient for these two titles is exactly 1. However, the employees in Job Title 2, despite starting at the same level, are making on average \$45,000 (or 90 percent of the starting salary) more than Job Title 1 at the end of the 5-year period. If Job Title 2 had annual increases of \$100,000 the correlation would still be exactly 1, but the employees with Job Title 2 would now have 10 times the salary at the end of period.
- 128. This is not simply a theoretical critique. While Dr. Leamer reported at his deposition that his correlation analysis showed an "astound[ing]" level of comovement, Dr. Murphy determined that average correlation between job titles was about 0.6. Pr. Leamer appears to be mistaken about the amount of co-movement that can be explained by a correlation of 0.6. Exhibit IV.17 shows the movement of total compensation for two Apple employees in the Class with a correlation of 0.65, slightly higher than Dr. Leamer's average. However, one observing their total compensation over time would probably not conclude that they move together, much less that the amount of co-movement was "astounding." While one employee experiences a steady increase in compensation over the nine year period, the second employee experiences a slight overall decrease in compensation before receiving a

Supplemental Expert Report of Kevin M. Murphy, June 21, 2013 ("Murphy June 2013 Supplemental Report"), ¶ 27 and Deposition of Edward E. Leamer, Vol. II, June 11, 2013 ("Leamer Deposition, Vol. II"), pp.560 – 3. ("A:...[M]y conclusion is I was astounded by the level of correlation that actually occurred in the context of the fact that there's all this – all this textual information to support this idea that there's somewhat rigid salary structure. So within that context the – you're way beyond the bar where there's evidence in the correlation structure of a somewhat rigid salary structure.")

²³⁰ These are demonstrations of a correlation for individual employees, but the same would be true for average compensation for job titles.

large reward in 2009 and 2010, which is then followed by another decrease in compensation in 2011. **Exhibits IV.18-IV.20** show similar patterns among employees at Adobe, Google, and Intel. In each case, despite having correlations of 0.6 the total compensations of the pairs of employees do not seem to move together in a rigid structure.

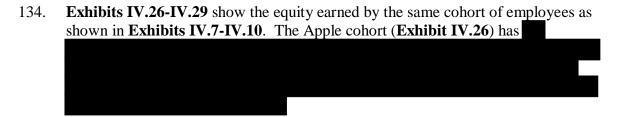

- 129. Second, regardless of how much one can conclude about the rigidity of compensation for the job titles from a correlation of 0.6 or Dr. Leamer's regression analyses, a simple example demonstrates why Dr. Leamer's pay structure analyses offer no insight to the question of internal equity. Assume a firm has three job titles in the Class: Software Engineer 1, Software Engineer 2 and Engineering Manager. Further, assume that within each of those job titles there are three distinct pay amounts. Therefore, in this company, there would be nine distinct compensation levels each year. Assume, further, that over the course of a 5-year period, within each job title the average pay increased by 5 percent every year. Finally, assume the number of employees at each pay level within a job title is the same every year. Based on this discussion it would be reasonable to conclude this firm had a rigid salary structure. In fact, in this example the correlation coefficient for each of the job title pair would be 1.0.
- 130. However, even within this rigid structure there would be plenty of room to move an employee who is a high performer and respond to offers from the outside, without disrupting the rigid structure whatsoever. For example, employees can be moved within the job title to a different pay level and equally importantly employees can be moved across job titles. At the end of a five year time period, the level of pay, and thus the changes in pay within those years, could be very different for any two employees. And, if one employee is more valued than the other, the company may not feel compelled to shift the second employee in response to outside information given to the first employee. This hypothetical example is consistent with the pattern of compensation shown in **Exhibits IV.7-14**.
- 131. For example, **Exhibits IV.21-24**, show the job titles each year for each of the same cohorts of employees in **Exhibits IV.7-14**. Over the five year period the cohorts at Adobe, Apple, Google and Intel ended up in five different titles and at Intel the cohort ended up in four different titles. In addition, over the five years one of the Google employees was never promoted, while others changed title three times. At Apple three of the 16 employees and at Adobe four of the eight employees were in titles that no one else in the cohort was in by 2009.
- 132. Finally, **Exhibit IV.15** shows every job title for the employees included in Dr. Leamer's Merits compensation regression that have at least 25 employees in at least one year. ²³¹ This exhibit demonstrates that across each of the Defendants there are

_

²³¹ Because there were very few job titles for Lucasfilm with at least 25 employees I lowered the threshold to 15 employees.

meaningful year to year differences in the number of employees included in each job title in Dr. Leamer's regression. The importance of this is two-fold. First, it demonstrates that there is enough movement within a firm that individual employees move in and out of job titles (or in and out of firms), which is consistent with the **Exhibits IV.21-24** above and corroborates my criticism of Dr. Leamer's common factors analysis. Second, it demonstrates that there will be meaningful changes in the mix of employees within each job title, which affects the average total compensation and renders meaningless Dr. Leamer's correlations and pay structure regressions.

- c. Dr. Leamer's Common Factor Analysis Does Not Support the Conclusion that Equity Has a Somewhat Rigid Structure.
- 133. While Dr. Leamer has stated that equity could be a tool used by firms to retain employees, the data do not support an opinion that equity payments are used to maintain internal equity or that changes in equity payments propagate through a firm. As shown in **Exhibit IV.25**, the variation explained by Dr. Leamer's common factors when looking only at equity is below 50 percent in all but two years, and as low as 29 percent in 2008.

135. Similar variation is observed in equity payments to Google employees. See **Exhibit IV.27**. For example, in 2010 Employee 27 earned in equity, which is more than any of the other employees earned over the entire 5-years. This shows that equity can be used selectively to reward high performers. Seven of the 34 Google employees earned smaller equity awards in 2011 (outside the alleged Class period) than they earned in 2007 (inside the alleged Class period), while one employee earned more than more in 2011 than 2007.

Even when the number of the employees is the same from one year to the next there could be important movement that affects the average compensation for that job title. For example, if a title had 25 employees in 2002, 17 of which were at the high end of the salary range and 14 of those 17 were promoted in 2003 and replaced by 14 new or newly promoted employees at the low end of the salary range, then the number of employees would be the same in the two years, but it is likely average salary would fall.

²³³ Leamer October 2012 Report, ¶ 97. ("Equity distributions are especially important for retaining critical employees during expansions when many firms are actively recruiting talent.")

See Exhibit IV.28.

Exhibit IV.29 shows that of the eight Adobe employees, only one received equity payments in every year (Employee 6) and four received equity only in the first year (Employees 4, 5, 7 and 8), including the three employees who earned the highest awards in 2007 (Employees 5, 7 and 8).

137. Finally, **Exhibit IV.30** shows that the percentage of employees who receive equity varies each year and by Defendant. The percentage of employees receiving equity varies significantly across Defendants, with some at zero, others around 50 percent,

The fact that substantial numbers of employees do not even earn equity further establishes that equity payments are not a means by which compensation suppression would be expected to propagate through the firm.²³⁴

- d. Google's Forever Google Grant Program Demonstrates that Compensation Changes Can Be Directed to Specific Employees Without Affecting Compensation of Other Employees
- 138. In 2007, due to increased competition for talent from Facebook and start-up companies, Google implemented a program in which

equity compensation and also deviates from Dr. Leamer's theory that compensation increases to some employees will propagate to cause compensation increases for others through considerations of internal equity. Instead, this program is an example of a Defendant being responsive to perceived direct market competition, but the response, while possibly large, can be directed to a small number of

The data show that

there is not a "ripple" effect to other employees from these large grants. Dr. Leamer has presented nothing to suggest that had three additional companies been able to cold call Google employees this program would have needed to compensate these targeted employees at even higher levels or that the number of employees targeted would have needed to be expanded. Arguably, this suggests that there should be no damages for Google, and at a minimum suggests that there should be no damages to employees who actually received such large compensation increases.

When I apply Dr. Leamer's model only to base salary there are no damages in aggregate, suggesting equity is an important driver of his damages. See **Exhibits IV.31** and **IV.32**. Given that his evidence does not support an alleged ripple could occur in equity due to the Defendants' pay structure, Dr. Leamer does not have an empirical foundation for why his damages would be concentrated in equity.

²³⁵ November 29, 2007 – Google Forever Grant Email Exchange, GOOG-HIGH-TECH-00519070.R – 1.R. The memo discusses

employees, without a concern of internal equity creating a ripple to the rest of the work force.

139.	The program was the result of consistent losses to Facebook of both potential recruits and existing employees. Several start-up firms also targeted senior Google
	employees with offers of "236 Google was concerned
	According to Dr. Leamer's internal equity theory, rewarding a
	few employees with a large compensation increase should have resulted in these
	increases "rippling" throughout all TCR employees. Hence, if Dr. Leamer were
	correct in his theory of a somewhat rigid compensation structure, we should see
	relatively large total compensation increases to all or substantially all Class
	members in 2007 or 2008. However, while the memo describing the Forever
	Google program

- 140. I have identified the employees who likely received Forever Google grants and compared those employees to the rest of Google's Class members. 239 As is demonstrated in **Exhibit IV.33**, there is no perceptible ripple to the remaining Class members. In every job level, it is evident that the grant recipients received a very large spike in total compensation in 2007, while the rest of the employees in the Class received compensation at their typical levels. In addition, the same exhibits show no increase out of the norm in 2008, so there is also no evidence of delayed ripple.
- 141. Dr. Leamer concludes from the Google "Big Bang" in 2011 that "even a small number of moves can generate broad and far-reaching changes in compensation." My analysis of the 2007 Google grant increase does conclude that increased competition for talent can lead to changes, but they need not be broad or far-reaching.

²³⁶ November 29, 2007 – Google Forever Grant Email Exchange, GOOG-HIGH-TECH-00519070.R.

²³⁷ November 29, 2007 – Google Forever Grant Email Exchange, GOOG-HIGH-TECH-00519070.R.

²³⁸ As described below, there is also no evident increase in cash compensation to the remaining TCR employees.

Based on the date of the Google Forever Grant Email Exchange, the stock price identified in the e-mail and the size of the grants reported in the compensation data, I am able to identify a group of individuals who appear to receive the grant on When I then match that list against the Class members in the backup to Dr. Leamer's regression analysis for the Leamer October 2013 Merits report, I find

²⁴⁰ Leamer December 2012 Reply Report, ¶ 53.

142. This example from Google is consistent with my opinion above that the data show that Dr. Leamer is wrong to conclude there is a somewhat rigid compensation that necessarily leads to broad-based compensation losses when even a small amount of "price discovery" is lost. Without that conclusion, there is no reason to believe that the DNCC agreements would lead to widespread and large damages because of small incremental decreases in information, relative to the other sources of information in the marketplace that I describe above.

F. Dr. Leamer's Theory that the Defendants Failed to Distribute Revenues to their Employees During the Conduct Period is Contrary to Available Evidence

- 143. In his Class report, Dr. Leamer suggests that as the Defendants' profits grow, the increase in profits will "likely [] be spent partly on raising wages and retaining key employees." He also suggests, but does not provide evidence, that the DNCC agreements were put into place as firm revenues "began to grow substantially" and were used to reduce the pressure to distribute some of those gains to their employees. 242
- 144. Dr. Leamer provides only one chart to illustrate his point about the growth of revenue per employee and average total compensation to employees over the period, suggesting that the non-compete agreements were enacted as Apple profits began to rise. Dr. Leamer's own chart, however, suggests that growth in average employee compensation in the conduct period actually outpaced growth in average revenue per employee, unlike Dr. Leamer's assertion. Dr. Leamer's Figure 9 shows that, although revenue per employee growth was relatively flat or negative through the conduct period, average total compensation per employee was growing faster during the conduct period than in the pre-conduct period, and faster than the growth in revenue per employee.
- 145. To examine this point, I have prepared **Exhibits IV.34 40**, which show the relationship between revenue per employee and average total compensation per employee for each of the Defendants over the relevant period. These exhibits show the ratio of average total compensation per Class member at a given Defendant to revenue per employee. For many of the Defendants, the percentage of the revenue per employee being paid as average total compensation to employees grew

²⁴¹ Leamer October 2012 Report, ¶ 99.

²⁴² Leamer October 2012 Report, ¶ 100.

²⁴³ Leamer October 2012 Report, ¶ 99 and Figure 9.

²⁴⁴ If an employee who was paid the average total compensation at a Defendant and who earned the average revenue per employee for a Defendant in a given year was paid 50% of those revenues as their salary, we would expect that percentage to be reflected in these charts.

over the conduct period, suggesting that these Defendants were actually distributing a higher percentage of their revenues to employees on average. For Apple in particular, the growth in the share of revenue per employee accounted for in employee compensation during the Class period followed a decline in the percentage of revenues being shared with employees as compensation prior to the Class period. Moreover, the ratio of average employee compensation to revenue per employee dropped following the Class period, suggesting "profit sharing" was actually at its greatest during the time period the alleged agreements were in effect. Growth in the average total compensation to employees as a percentage of the revenue per employee during the Class period is also seen at Adobe, Intel and Lucasfilm.

V. Dr. Leamer's Damage Model Is Misspecified and Inaccurate

A. Overview of Dr. Leamer's Damages Methodology

- 146. Dr. Leamer purports to estimate the alleged undercompensation to Class members due to the alleged conspiracy using a regression model that attempts to determine the amount by which each Plaintiff's total compensation was reduced during the years in which DNCC agreements were in effect, after controlling for certain characteristics of the firm and individual. Dr. Leamer's model estimates compensation as a function of variables that are specific to the employee (age, tenure, gender, location, and recent compensation history), the firm (firm hiring rate, and revenue per employee) and additional control variables that take on the same value for all employees at all firms for a particular year (an annual time trend, employment in the industry, the total number of new hires for all seven Defendants, and the total number of transfers among all Defendants).
- 147. Only certain variables in Dr. Leamer's compensation regression are specific to the particular employee. These include the employee's age and its squared value, the employee's tenure and its squared value, an indicator variable for whether the employee is male, and a set of indicator variables for the state where the employee works. Also specific to the given employee are that employee's total compensation from the previous two years; Dr. Leamer allows the effect of the previous two years' compensation to have differential effects at different firms (e.g., last year's compensation may have a different effect on this year's compensation for employees at Google compared to employees at Apple). The inclusion of the

²⁴⁵ Total compensation includes an employee's base salary, cash bonus and an estimated value of equity grants. The total compensation variable in Dr. Leamer's regression is adjusted for changes in the CPI such that he is measuring the impact on real compensation rather than nominal compensation. Nominal compensation is the employee's earnings in dollar terms and is what the firm will set or negotiate with the employee. Real compensation reflects the buying power of the employee's compensation and differs from nominal compensation depending on the overall inflation rate of the economy.

²⁴⁶ See Leamer October 2012 Report, ¶¶ 142 − 7, for a fuller description of the variables included in his analysis.

previous two years' compensation also affects the composition of the subset of employees on which his regression is estimated – only years in which the employee has been at the firm for three years or more are able to be included in the estimation of the model.²⁴⁷ See **Exhibit V.1**. All of the other variables in Dr. Leamer's regression are the same across all employees for a given firm in a given year.

- 148. One additional factor omitted from Dr. Leamer's compensation regression that he included in his "common factors analysis" is a set of fixed effects for job title. While the model chosen by Dr. Leamer does not allow for the inclusion of fixed effects for the job titles at every company, job title, and promotions from one job title to another, may nonetheless give information about an employee's abilities, talents or job prospects that is not otherwise controlled for in the model. An employee who has distinguished himself from his colleagues may be rewarded with a promotion and a salary increase. Without the ability to control for the change in title that accompanied the promotion, Dr. Leamer's model will assume that the salary increase should have propagated to other workers of the same age and tenure, when instead the employee in question was deliberately being set apart from his peers. Dr. Leamer's model cannot distinguish deliberate and intentional salary differentials from actual harm, if any, arising from the DNCC agreements.
- 149. Job title and promotion history are not the only variables omitted from Dr. Leamer's model. Other important control variables, such as controls for the end-of-Class-period recession and firm-specific compensation events, are also omitted from Dr. Leamer's model. These and other limitations of Dr. Leamer's model are discussed in Section VII below.
- 150. After controlling for certain, but not all, factors that affect compensation, Dr. Leamer attempts to measure the effect of the alleged anticompetitive behavior by evaluating whether compensation changed during the years in which a DNCC agreement between Defendants was allegedly in effect. The centerpiece of Dr. Leamer's measurement of damages is his "conduct" variable, which operates similarly to an indicator variable. He sets the variable to be 1 in years in which the Defendant had one or more of the DNCC agreements in place for the full year and 0 in years in which a DNCC was not in place. In years in which the agreements at issue were not in effect for the full year, Dr. Leamer sets the "conduct" variable to be equal to the assumed proportion of the year over which an agreement was in place. Thus, because the agreements for all seven Defendants ended in March of 2009, the "conduct" variable takes the value 0.25 for all seven Defendants in that

²⁴⁷ Due to the nature of lagged variables, all observations from years 2001 and 2002 are dropped, regardless of how long an employee has been at the Defendant's firm.

- year. ²⁴⁸ It takes the value 0.5 for Adobe, Apple, Google, and Intel in 2005 and for Intuit in 2007, when Dr. Leamer assumes those firms entered into their DNCC agreements. ²⁴⁹
- 151. Dr. Leamer also interacts the Class period variable with the age and square of age of the employee, and the hiring rate of the employee's firm. He thus allows for the possibility that the firms' alleged behavior had differential effects on employees of different ages, or at firms that had been doing different amounts of hiring relative to their total number of employees. However, he has not opined on the reasons why he would expect the DNCC agreements to affect individuals differently at different ages and at different firms, but not, for example, during different years or for different job titles. ²⁵¹
- 152. For ease of discussion, the results of Dr. Leamer's compensation regression are replicated in **Exhibit V.2** to this report. Dr. Leamer concludes that, all else equal, these results indicate that there was undercompensation during the Class period and undercompensation was greatest for young employees and old employees but lessened for middle-age employees. The model also appears to suggest that undercompensation was greater for firms that were expanding (hiring greater numbers of new employees). Based on the coefficients on the "conduct" variables, Dr. Leamer's model finds that all employees in the Class were undercompensated at all seven Defendants in each year from 2005 to 2009. The aggregate alleged undercompensation to the Class according to Dr. Leamer's model is about \$3.1 billion, or roughly 10 percent of total compensation to the Class.

²⁴⁸ While Dr. Leamer calls his fixed effect variable that purports to measure the effect of the alleged conspiracy "conduct", it is essentially a dummy variable as discussed above. I refer to it as the "Class period variable" in the text, but display it as "conduct" similar to Dr. Leamer on the Exhibits to my Report that display regression results.

²⁴⁹ Pixar and Lucasfilm entered into a DNCC agreement with each other prior to 2001, therefore the Class period variable takes on the value 1 for those companies in all years prior to 2009.

²⁵⁰ "Interacting" a variable with another variable simply means including the product of the two variables in the regression.

Leamer Deposition Vol. III., p. 935. ("Q. You have also theorized that younger employees and employees with shorter tenure are less likely to be cold-called; correct? A. By the word "younger," I would say the youngest are probably not the target of cold-calling. Somebody who has just graduated from college and been hired in the first month, that seems to me unlikely to be the target of cold-calling. But at some time later - - it's not the oldest, but at some time later, you're going to become a target for cold-calling.") And, Leamer Deposition Vol. III., p. 1071. ("Q. You would eliminate the disaggregated conduct variables and do - - and insert the four that you chose? A. Or - - or find some other variable. I made a concerted effort to find variables that would help me understand why these firms were different. I know they're not identical, but they're not perfectly distinct, either.")

²⁵² While the coefficient on the hiring rate interaction is negative, the hiring rate itself is the logarithm of a value between 0 and 1, and hence negative. As a result, the net impact of the interacted hiring rate variable on compensation is positive. As hiring rate increases this effect approaches 0, and therefore overall alleged undercompensation (measured by all four of Dr. Leamer's conduct variables) increases.

²⁵³ Dr. Leamer presents three alternative regression methodologies in Exhibits 4 – 6 of his October 2013 Merits Report. All three of these alternative specifications estimate alleged damages greater than or equal to \$3.1 billion. As noted in his Merits Report, Dr. Leamer does not see any improvement from these models over his "updated original" model presented in

- **Exhibit V.3** shows Dr. Leamer's alleged damages by Defendant and year. ²⁵⁴ Intel has the largest alleged damages at over \$1.4 billion, followed by Google (approximately \$774 million) and Apple (approximately \$508 million). Due to Dr. Leamer's alleged persistence effects, alleged damages tend to grow larger year-on-year over the Class period.
- 153. While Intel has a very large total damages number, it is not the case that its alleged undercompensation percentage is greater than that of the other firms. Looking at the alleged undercompensation as a percentage of total actual compensation (see **Exhibit V.9**), Lucasfilm and Pixar actually have the greatest percent undercompensation according to the results of Dr. Leamer's model. Intel tends to have one of the lowest undercompensation percentages among the seven Defendants in any particular year.
- 154. There are numerous flaws in Dr. Leamer's damage model. The model suffers from specification errors and is improperly specified to test the theory of harm alleged. The model yields counter-intuitive and implausible results that are inconsistent with Plaintiffs' theory of harm or well-established relationships in labor economics. The model is not robust to minor changes in specification: "damages" are greatly diminished or eliminated entirely when minor changes are made to the specification. More finely tuned tests for the impact of the DNCC agreements at issue show that there is no Class-wide impact on compensation from these agreements. Below, I describe each of these errors in more detail and discuss the impact they have on Dr. Leamer's damages estimates and conclusions regarding impact.

B. The Specification of Dr. Leamer's Model Is Inconsistent with his Theory of Harm

155. The specification of the damage model chosen by Dr. Leamer is not consistent with his theory of harm. Dr. Leamer's theory of harm is that a reduction in information available to employees allowed firms to undercompensate Class members without fear of losing those employees to competitors with better opportunities. However, as shown above, there is no *a priori* reason to believe that the amount of information available to employees was meaningfully reduced during the Class period, and Dr. Leamer acknowledges that the agreements between pairs of Defendants could have led to increased cold calling to other Defendant firms. Dr.

Exhibits 2 and 3. (Leamer October 2013 Merits Report, $\P 41 - 3$.) I therefore focus the critiques of this report on that model.

²⁵⁴ See **Exhibits V.4 – V.8** which display damages for each of the Named Plaintiffs.

Dr. Leamer acknowledged that there is a "presumption" that Defendants would increase cold calling to Defendants with which they do not have an agreement. Leamer Deposition Vol. III., p. 1085. ("Q. So do you have any opinion at all as to whether Apple's inability to place cold-calls to Adobe employees would increase the likelihood that it would call Intel employees? A. Well, this comes back to the substitution possibility, and the presumption would be that there would be some substitution.

Leamer's model does not allow one to evaluate whether the measured undercompensation in the Class period is caused by a reduction in cold-calling from the Defendant firms rather than other factors not included in the model. The Class period variable that Dr. Leamer uses to measure damages is not tied to a reduction in cold-calling, but rather to a time period in which the agreements at issue existed regardless of whether they were effective at reducing the alleged flow of information to a firm's employees. As discussed below in Section VII, any economic events that occurred in the Class period and not outside the Class period are being picked up by Dr. Leamer's Class period variables that turn on from 2005 to 2009 and off outside of this period.

- 156. Nothing in Dr. Leamer's damage model measures information available to employees, frequency of cold calling, or suppression of information. Dr. Leamer acknowledges that cold-calling, recruiting and employee movement continued throughout the Class period, but asserts without support that the amount of price discovery information available to employees was reduced. ²⁵⁶ Dr. Leamer does not allow for a differential impact when there is allegedly greater suppression of cold calls (*e.g.*, entering into a DNCC agreement with a larger firm doing a significant amount of hiring or entering into more than one DNCC agreement) as opposed to less suppression of cold calling (e.g., entering into a DNCC agreement with a small firm doing relatively little hiring or entering into a single DNCC agreement). Dr. Leamer therefore makes no attempt to link damages to the amount of information allegedly suppressed, or the magnitude of potentially lost job opportunities for the Class.
- 157. A proper test of the theory would evaluate whether the magnitude of allegedly reduced information affects compensation as opposed to the mere fact of an agreement. That is, a firm that is trying to hire 1,000 employees, but who cannot call Apple's employees directly should reasonably have a larger impact on information flow than a firm that is attempting to hire 10 employees but cannot call Apple's employees directly.
- 158. The reasoning is straightforward and suggested by Plaintiffs' own theory of harm. Own-firm hiring is expected to raise compensation at the firm doing the hiring: Dr. Leamer's model shows a positive coefficient on his hiring rate for individual

Q. The presumption would be that if Apple can't call Adobe employees, it's more likely to call Intel employees; correct? A. Correct.").

²⁵⁶ Leamer October 2012 Report, ¶ 72 and Leamer October 2013 Merits Report, ¶ 11. ("The speed at which price discovery operates depends on the manner in which, and how rapidly, information is disseminated among buyers and sellers. Cold-calling is part of the normal information dissemination process, and non-compete agreements that limit the flow of information about opportunities slow down the price discovery process and thus affect each and every labor contract in a way that works adversely for workers and to the benefit of firms engaged in the Non-Compete Agreements.")

- firms.²⁵⁷ Thus, the firm that is doing a proportionally greater amount of hiring should have higher compensation than a firm doing proportionally less hiring, all else equal. The increased compensation at the firm that is expanding then represents positive outside opportunities relative to a firm that is doing proportionally less hiring. Impact should therefore be greatest if the firm with which a company has a DNCC agreement is expanding relative to the reference firm.
- 159. Dr. Leamer's model does not allow this variation to be reflected in his model even though it is consistent with both his theory and the results of his model. The Class period variable is forced to have a constant impact across firms regardless of the market activities and opportunities at the firm (or firms) with which each Defendant entered into a DNCC agreement. Dr. Leamer's Class period model does not even allow for greater impact based on the number of agreements a Defendant has, something Dr. Leamer acknowledges should in theory occur.²⁵⁸
- 160. Because Dr. Leamer forces the impact of the Class period variable to be constant regardless of the magnitude or importance of information suppressed, Dr. Leamer's damages specification is not consistent with his theory of the way in which the conduct at issue is alleged to cause harm to employees. The "information" available to employees is not part of the model or estimated in any way. His model does not allow one to evaluate whether the alleged impact is related to a reduction in cold calling, a reduction in any information flow, or some other factor. As shown in Section IV above, there is no meaningful indication that information to employees was reduced, and therefore no basis to assume that the effect Dr. Leamer appears to be measuring arises from a reduction in information flow as opposed to other micro and macroeconomic factors that occurred concurrent with the Class period, but are lumped into a common conduct variable that affects all firms equally. ²⁵⁹

²⁵⁷ See Leamer October 2013 Merits Report, Exhibit 2, variable #27.

Leamer Deposition Vol. III., pp. 982 – 3. ("Q. So under your model, it doesn't matter whether it's three agreements, one agreement, or twelve agreements. It's either on or off? A. Correct. Q. But you would agree with me that logically a firm that has an arrangement such that it's not being cold-called by three other firms is inhibiting more information than if it only had an agreement with one of those three firms? ... A. That I would agree, but then the question is what impact that has. The equation's about impact, and you know, I accept the premise of this discussion that you could try to distinguish the impact depending on the character of the agreement rather than just the presence. Q. But you didn't do that, did you? A. I explored some of that, but didn't find it something that data would tolerate.")

²⁵⁹ This point is discussed in more detail in Section VII below.

C. The Coefficients on Variables in Dr. Leamer's Regression Have Counter-Intuitive Interpretations

- 161. A well-known effect of misspecification and omitted variables in regression analyses is that coefficients can be estimated with the "wrong" sign. ²⁶⁰ This seems to be the case with Dr. Leamer's analysis. Dr. Leamer's regression produces unexpected results with respect to the effect of age and other variables on compensation. The results of his regression show a negative coefficient with respect to age, and a positive coefficient with respect to age-squared. ²⁶¹ This is contrary to the expected signs based on economic literature on wage modeling. ²⁶² The implication of Dr. Leamer's result is that the older a person is, the less they are expected to be paid, all else equal. This effect reverses at age 63, at which point the impact of age on an employee's compensation becomes less negative as age increases. See Exhibit V.10.
- 162. The counter intuitive signs on Dr. Leamer's age variable only occur on the age variables that have not been interacted with the Class period variable, which is when Dr. Leamer's model purports to measure compensation absent any of the agreements at issue. Within the Class period, the interactions between the age variables and the Class period variable have the expected sign positive on the interaction between the Class period variable and age, negative on the interaction between the Class period variable and the square of age. The implication for damages based on these variables is that the alleged conduct has the smallest impact on an employee aged 40 or 41, with the effect of the alleged conspiracy getting larger the further an employee gets away from this age. Dr. Leamer's model therefore concludes that very young or old employees have larger

²⁶⁰ See Peter Kennedy, A Guide to Econometrics, Sixth Edition, (Blackwell Publishing, 2008) ("Kennedy"), pp. 368 – 71. (A wrong sign is an indication that "there is undoubtedly some shortcoming in one's theory, data, specification, or estimation procedure.")

²⁶¹ See Leamer October 2013 Merits Report, Exhibit 2, variables #19 and 20.

Dr. Leamer also believes that wages increase with age, until about age 55 when they start to decline. Leamer Deposition Vol. III., p. 935. ("A. How is age related to compensation? I suppose it's true in most industry [sic], but these are firms that have upward sloping compensation as a function of age, and peaking out at probably 55 years old or something like that as a shape of the wage age profile..."). See also Orley Ashenfelter and Richard Layard, eds., Handbook of Labor Economics Volume I, p. 603. ("The major stylized facts which the theory attempts to explain are: a life cycle earnings profile which is increasing at early ages and is declining towards the end of the working period.") See also George Borjas, Labor Economics, Fifth Edition, (McGraw-Hill, 2010), p. 64. ("...[A] great deal of evidence suggests that the typical worker's age-earnings profile-- the worker's wages over the life cycle-- has a predictable path: wages tend to be low when the worker is young; they rise as the worker ages, peaking at about age 50; and the wage rate tends to remain stable or decline slightly after age 50.")

²⁶³ This result is exactly the opposite of the signs on the age and age-squared coefficients that Dr. Leamer obtained in his common factors analysis. See Leamer October 2012 Report, Figure 11.

²⁶⁴ See Leamer October 2013 Merits Report, Exhibit 2, variables # 1 and 2.

- undercompensation percentages than middle aged employees.²⁶⁵ See **Exhibit V.11**. I have seen nothing in Dr. Leamer's explanation of his theory to explain this result.²⁶⁶
- 163. The counter-intuitive signs in Dr. Leamer's model are not limited to the variables related to age. The model also estimates negative coefficients on both the total number of new hires among the seven Defendants, the revenue per employee from the prior year, and the annual time trend. Taken at face value, Dr. Leamer's results imply that, all else equal, as the firms are doing more hiring, they pay their employees less. This runs contrary to basic economic principles and suggests that Dr. Leamer's model suffers from an endogeneity problem, in which case it is unreliable as an estimator of damages. The fact that the signs on the coefficients on revenue per employee and the time trend are also negative is counterintuitive and suggests an underlying problem with the model. As shown above, over the course of the Class period, the Defendants are expanding, revenue is growing, and total compensation per employee trends upward. The fact that Dr. Leamer's model suggests a negative relationship between these variables is unsupported by any economic theory that he has offered.
- 164. The presence of counterintuitive and unexplained results is a significant flaw in Dr. Leamer's report. Economists rely on economic theory to guide an analysis and give meaning to the results. For example, if, when estimating a demand curve for a product, an economist found that demand sloped upward (i.e., higher prices caused consumers to purchase more of a product), the economist would take that counterintuitive result as a signal that there was a flaw in the model and not trust the results of the model until the specification was tested and determined to be reliable such that it yielded reasonable predictions consistent with economic theory and market facts.
- 165. Because Dr. Leamer's model produces counter-intuitive results and Dr. Leamer has not provided an explanation for why the unusual results are reasonable in this

²⁶⁵ Dr. Leamer acknowledged that the fact that his model gives the youngest employees larger impact "worries" him and that this result is "inappropriate." Leamer Deposition Vol. III., p. 953. ("A. And then when I get this anomaly, which worries me too, the fact that the youngest workers have the largest impact ... I think it's inappropriate to think that the very youngest workers are going to have the most impact of the cold-call.")

²⁶⁶ In fact, in deposition Dr. Leamer theorized that the youngest are probably not the target of cold-calling. Leamer Deposition Vol. III., p. 935. ("Q. You have also theorized that younger employees and employees with shorter tenure are less likely to be cold-called; correct? A. By the word "younger," I would say the youngest are probably not the target of cold-calling. Somebody who has just graduated from college and been hired in the first month, that seems to me unlikely to be the target of cold-calling.")

²⁶⁷ See Leamer October 2013 Merits Report, Exhibit 2, variables #26, 28, and 29.

²⁶⁸ See Kennedy, p. 139. ("Endogeneity gives rise to estimates biased even asymptotically...")

market setting, one can have no confidence that the impact and damages he estimates from the model are reliable.

D. Dr. Leamer Fails to Examine the Significance of His Class Period Variable Coefficients Using Clustered Standard Errors

- 166. In response to criticism at the Class certification stage by Dr. Murphy, Dr. Leamer corrected the method by which he estimated the precision of his coefficient estimates to account for the fact that many of his explanatory variables vary only by employer and year, but not by employee. While Dr. Leamer includes the corrected standard errors in Exhibit 3 to his report, he fails to address the fact that when his standard errors are correctly estimated, two of his four Class period variables are no longer significant. 270
- 167. Dr. Leamer dismisses the importance of this modification, saying it is "irrelevant for the task of determining the best estimate once the model is decided upon" because "[a] damage estimate with a large standard error will still be the best estimate." However, while it is true that the coefficient estimates are unchanged using the corrected method of determining standard errors, Dr. Leamer is incorrect in suggesting that the standard errors of a regression are immaterial. The standard error of a coefficient estimate is what determines statistical significance, that is,

²⁶⁹ Dr. Leamer states in his Report that "not every single individual can be viewed as an independent 'experiment' for purposes of estimating standard errors." Leamer October 2013 Merits Report, ¶¶ 22 – 31. Clustering the standard errors is a "generally accepted method" to correct for this issue. Murphy November 2012 Report, ¶ 126.

²⁷⁰ The determination of statistical significance is made using a p-value, defined as "the probability of drawing a statistic at least as adverse to the null hypothesis as the one you actually computed in your sample, assuming the null hypothesis is correct." (James H. Stock and Mark W. Watson, Introduction to Econometrics, (Pearson-Addison Wesley, 2003) ("Stock and Watson"), p. 62.) This is the probability that one would see the same relationship observed in the data if the relationship does not actually exist. Stock and Watson note, "In many cases, statisticians and econometricians use a 5% significance level...In some legal settings the significance level used is 1% or even .1%, to avoid this sort of mistake." (Stock and Watson, pp. 68-9.) Dr. Leamer describes the p-value of a coefficient as "another way of characterizing how much uncertainty there is in that particular coefficient." (Learner Deposition Vol. III., p. 1036.) But he does not advocate rejecting the conduct variables because they are individually insignificant. Instead, he believes the appropriate null hypothesis is not zero damages, because he believes that the alleged agreements did suppress compensation for the entire Class; thus, his conduct variable must have a negative relationship to compensation. Instead of no conduct being the hypothesis to reject, Dr. Leamer suggests using 10 percent suppression as his hypothesis. Leamer Deposition Vol. III., p. 1037. ("Q. So setting the coefficient to zero is the null hypothesis; correct? A. That is a null hypothesis, and that is not the appropriate null hypothesis in this case. Q. What is the appropriate null hypothesis in this case? A. If you mean by null hypothesis zero damages, that seems to me to have been decided upon by all the textural and testimony and documents. And the question isn't whether there's zero damages; the question is how large they are. So I would suggest that Google's decision to do the across-the-board 10 percent increase in compensation in their big bang, that's the natural null hypothesis.") Typically, a null is constructed to be rejected, but the way Dr. Leamer has constructed his null, he cannot reject it, only accept it. (Stock and Watson, pp. 61 - 2.)

Leamer October 2013 Merits Report, ¶ 26. As a threshold matter, it does not make sense to assert that the predictions of a model must be used in a damages analysis "once the model is decided upon" as Dr. Leamer asserts. Dr. Leamer's model fails to establish proof of impact, and therefore there is no basis to assert that the amount of alleged undercompensation predicted by the model represents damages.

- whether the model provides evidence that the true value of a coefficient is different from zero. If a coefficient estimate is not statistically significant, then the model has not found sufficient evidence to reject the null hypothesis that the true impact of the relevant variable is zero.
- 168. An examination of Dr. Leamer's Exhibit 3 to his Merits Report shows that the switch to clustered standard errors is not "irrelevant." Using this model, two of Dr. Leamer's four coefficients meant to measure the impact of the alleged conduct at issue, the un-interacted Class period variable and the Class period variable interacted with the firm's hiring rate, are no longer significant. This means that Dr. Leamer's model has not been able to estimate these coefficients precisely enough to conclude that their true values are not, in fact, 0.
- 169. **Exhibit V.12** shows the implied damages from Dr. Leamer's model broken down by his four Class period coefficients. Dr. Leamer's Class period indicator accounts for almost all of the damage estimate, adding \$3.3 billion to his total damage amount.²⁷²
- 170. **Exhibit V.13** shows the damages to the Class if it is assumed that the coefficients on the Class period indicator and the Class period variable interacted with hiring rate are 0. As mentioned above, Dr. Leamer's model does not find enough evidence to reject the hypothesis that 0 is the true value of the coefficients. Without the influence of the insignificant variables, damages to the Class are measured at about \$414 million, a reduction of over \$2.5 billion from Dr. Leamer's estimate.
- 171. **Exhibits V.14** and **V.15** show the results of re-estimating Dr. Leamer's model without the two Class period variables that are statistically insignificant. As shown in the exhibits, the model containing only the statistically significant Class period variables from Dr. Leamer's original regression finds estimated damages of approximately \$910 million, more than \$2 billion less than Dr. Leamer's estimate.
- 172. These calculations demonstrate that a substantial majority of Dr. Leamer's damage estimate is being driven by variables that are statistically insignificant. Despite Dr. Leamer's statements to the contrary, using clustered standard errors (a necessity given the alleged relationship between employees' compensation in each year derived from the Plaintiffs' theories about interconnected compensation due to somewhat rigid pay structures at the Defendants) casts substantial doubt on the validity of Dr. Leamer's claim that the Class was damaged by more than \$3 billion.

²⁷² Total damages are less than \$3.3 billion because the effect of own hiring is to reduce damages, and the combined effect of the age and age squared specification adds significantly less to the total.

VI. Modifications to Dr. Leamer's Regression Model Demonstrate that His Alleged Damages Amount is Unreliable

173. As discussed above, Dr. Leamer's model is inconsistent with his theory of harm and yields results that are implausible in light of the nature and magnitude of the restriction alleged. In this section, I present several minor changes to Dr. Leamer's model. If the regression model were robust, I would expect these alterations to have minimal impact on the estimation of alleged damages. However, as will be shown below, reasonable amendments to Dr. Leamer's model undermine Dr. Leamer's contention that damages are in excess of \$3 billion.

A. Dr. Leamer's Results Rely on His Adjustment of Compensation by the CPI

- 174. Dr. Leamer adjusts all variables measured in dollars in his regression by the Consumer Price Index (CPI), which accounts for inflation. While this is not an unreasonable adjustment to make in some contexts, because of the recession that occurred during the Class period, it suggests that running the model on nominal figures would be expected to produce a more accurate result.
- 175. Defendants could not have consistently known with certainty what inflation was going to be in the coming year as they were setting the compensation of their employees. If one of the companies attempted to give an employee a large raise, but it turned out that inflation was much higher (or lower) than expected in the following year, Dr. Leamer's calculations would show that employee getting a much smaller (or larger) raise than the employer intended, or possibly even a decrease in real compensation. This possibility is realized in this case with the impact of the recession that occurred at the end of the conduct period. While inflation could have been anticipated to drop during this period, even economists were not able to predict the severity of the reduction. The Livingston Survey conducted by the Federal Reserve Bank of Philadelphia gauges economists' expectations on a number of different indices, including the CPI utilized by Dr. Leamer. In December 2008, economists' mean 12-month prediction of inflation was 1.2 percent, with the 12-month median prediction being 1.1 percent.²⁷³ In actuality, the US economy experienced deflation during this period of -0.3 percent, based on the CPI figures used by Dr. Leamer in his regression data. Dr. Leamer asserted in deposition that firms are "aware" of inflation when making compensation decisions. 274 But Defendants Google and Intel made most of their

²⁷³ Median Data and Mean Data, Historical Data: Livingston Survey, available at http://www.phil.frb.org/research-and-data/real-time-center/livingston-survey/historical-data/, accessed on November 22, 2013.

²⁷⁴ Leamer Deposition Vol. III., p. 925. ("Q. And so you would agree that in terms of modeling how administrators actually made compensation decisions, nominal compensation would be the way to go here? A. No, I don't agree with that. Q. Why is that? A. Well, these firms are aware of inflation…")

salary decisions in the first quarter of the year, well before the average CPI level that Dr. Leamer uses to adjust total compensation is determined.²⁷⁵ With their compensation decisions made in advance of unforeseen changes in the inflation rate, Google and Intel were likely not "aware" that the real compensation of their employees was going to be greater than expected in 2009 due to a fall in the inflation rate, just as the conduct at issue allegedly ceased. The fact that this unforeseen shift happened at the end of the Class period presents issues for Dr. Leamer's regression, which relies on comparing wages during the Class period with those in other years.

176. When Dr. Leamer's model is run on nominal compensation (*i.e.*, the compensation that the Defendant companies can actually set and control), making only this and no other changes, it changes Dr. Leamer's estimate of damages to approximately \$1.8 billion, substantially less than the \$3.1 billion in damages originally estimated by Dr. Leamer's model. See **Exhibits VI.1** and **VI.2**. Therefore, a considerable portion of Dr. Leamer's damages appear to be caused by changes in inflation; a fact that could not have been known by the Defendants and is unrelated to any alleged conduct.

B. Dr. Leamer's Model Does Not Allow for Variation in the Effect of the Alleged Conduct across Defendants

- 177. Dr. Leamer's model allows for almost no variation in the alleged impact of the DNCC agreements between the Defendants. While there is some variation in the specific estimated damages due to differences in the employee age composition and hiring rates at different firms, the same four Class period-related coefficients apply to all seven Defendants. This means that while Intel's employees may be older than Google's, the effect of age on the impact of the conduct is the same at both Intel and Google. The only true variation by employer he allows for in his alleged damages calculation is in the estimation of the persistence effects of the alleged conduct over time, since he allows the coefficients on the previous years' compensation to vary by employer. ²⁷⁶
- 178. Dr. Leamer imposes uniformity in the impact of the alleged conduct across the Defendants despite the fact that there was considerable heterogeneity in the way in which they set compensation, as discussed in earlier sections, and in the alleged

²⁷⁵ See Section III.3 and III.4. Google made compensation decisions in the first quarter of the year in 2005 and 2006, but in the fall beginning in 2007. (Wagner Declaration, ¶ 15.)

²⁷⁶ However, as discussed Section V.A., including lagged compensation values in the regression model introduces other econometric problems to Dr. Leamer's damage model.

HIGHLY CONFIDENTIAL – ATTORNEYS' EYES ONLY Modifications to Dr. Leamer's Regression Model Demonstrate that His Alleged
Damages Amount is Unreliable

- conduct itself. As noted at the outset, not all Defendants had the same number of DNCC agreements.²⁷⁷
- 179. Because Dr. Leamer's model imposes the condition that the alleged Class period coefficients are the same for all Defendants, adjustments that theoretically would only impact one Defendant in fact affect them all. As discussed above, I understand that Intel may not have entered into any sort of DNCC agreement until 2006, even though Dr. Leamer's model assigns Intel's Class period variable a value of 0.5 for the year 2005. I have re-estimated Dr. Leamer's model, with the only alteration being that Intel's Class period variable is set to 0 in 2005. See **Exhibits VI.3** and **VI.4**. ²⁷⁸
- 180. As can be seen on the exhibit, this change implies that total damages are reduced by over \$1 billion as compared with Dr. Leamer's estimates.

This shift in fair value price was not caused by the DNCC agreements. By using a 2005 start date for the agreement, Dr. Leamer is moving into his Class period variable a change in compensation that was unrelated to conduct and prior to Intel's agreement. Not only have the alleged damages estimated by the model been reduced for Intel, but all seven Defendants have lower damages than Dr. Leamer posits. This result demonstrates that Dr. Leamer's restriction that the effect of the alleged conduct be the same across the Defendants causes his model to estimate alleged damages in an illogical fashion.

181. In **Exhibits VI.5** and **VI.6**, I have estimated Dr. Leamer's model without the restriction that the Class period coefficients be the same for all 7 Defendants. Without the constraint that the effect of the alleged conduct be the same across all employers, the model estimates damages of approximately \$1.2 billion, less than half of the alleged damages estimated by Dr. Leamer's model. Examining the results by Defendant, once Dr. Leamer's model is permitted to differentiate the alleged impact of alleged conduct between the firms, the model finds net overcompensation by Lucasfilm and Pixar in each year of the Class period. Google

²⁷⁷ See Section III and ¶¶ 10 and 11.

²⁷⁸ **Exhibits VI.3** and **VI.4** show the results of running Dr. Leamer's model with Intel's Class period variable set to 0 in 2005 in real terms. The nominal model setting Intel's Class period variable to 0 appears in the Appendix (see **Appendix Exhibit VI.1** and **Appendix Exhibit VI.2**) and shows directionally similar results.

Note that this model uses Dr. Leamer's Class period variable without the alteration for Intel described above. I have allowed the four Class period coefficients to vary by employer; in doing so, I have also allowed the 3 variables interacted with the Class period variable (age, squared age, hiring rate) to vary by employer as well. In allowing (for example) the effect of the Class period variable to vary by age and Defendant, it is necessary to allow the effect of age, un-interacted with the Class period variable, to vary by Defendant also. Exhibits VI.5 and VI.6 show the results of running Dr. Leamer's model disaggregating the Class period variable effects in real terms. The nominal disaggregated Class period variable model appears in the Appendix (see Appendix Exhibit VI.3 and Appendix Exhibit VI.4) and shows directionally similar results.

is estimated to have net overcompensation overall, though not in each individual year. Adobe's alleged damages are approximately one-third of those estimated by Dr. Leamer, while Apple's alleged damages are just over half of those from Dr. Leamer's original model. Intuit is found to have greater undercompensation than Dr. Leamer's model estimates when the effect of the alleged conduct is allowed to vary by employer.

C. Dr. Leamer's Results Rely on His Aggregation of Total New Hires Across all Defendants as a Control Variable

- 182. A significant shortcoming of Dr. Leamer's damage model is his failure to control for and test the impact of the information that was actually lost on compensation outcomes for the Class. As stated above, the specification of Dr. Leamer's damage model is inconsistent with his theory of harm. Nothing in Dr. Leamer's model measures changes in information available to the Class or tests whether the asserted reduction in cold-calls meaningfully changed the information available to Class members or altered the strength of their negotiating position. As stated above, a proper test of the theory would evaluate whether the magnitude of reduced information affects compensation as opposed to the mere existence of an agreement.
- 183. One way of controlling for the magnitude of the alleged reduced information is to account for the volume of hiring being conducted by firms with which the reference firm has a DNCC agreement. Dr. Leamer's compensation regression includes the total number of new hires per year by all seven Defendants as an explanatory variable. But this variable combines the impact of the hiring by firms with whom each Defendant has a DNCC agreement with the impact of hiring by other Defendants. Moreover, Dr. Leamer's new hire variable is the sum of the new hires by each Defendant firm in each year and is, therefore, the same for every employee in the data set in a given year and is restricted to have the same effect on compensation at every firm, regardless of the number and relative importance of each firm's DNCC agreements to their compensation structures.
- 184. Dr. Leamer aggregates new hires across all Defendants despite the fact that his theory of harm suggests that the different components of this variable should have different effects on employee compensation. To see this, note that the new hires variable can be broken down into four distinct categories: (1) new hires at the employee's own firm; (2) new hires at another firm with which the employee's firm did not have a DNCC agreement; and (3) new hires at another firm with which the employee's firm had a DNCC agreement while that agreement was in effect; and (4) new hires at another firm with which the employee's firm had a DNCC agreement while that agreement was not in effect.

²⁸⁰ See Leamer October 2013 Merits Report, Exhibit 2, variable #28.

- 185. Dr. Leamer only allows the impact of new hires at the employee's own firm to be different from the impact of other new hires. However, his model forces the compensation effect of hiring by the other Defendants to be the same regardless of whether the firm had a DNCC agreement in place with each Defendant.
- 186. It is inconsistent with Dr. Leamer's theories in this case for the compensation effect of new hires from firms with which the employee's firm had a DNCC agreement to be the same as the compensation effect of new hires from firms with which the employee's firm did not have a DNCC agreement. If the effect on compensation of the two categories were the same that would imply that the DNCC agreements should, in fact, have no effect, since any firm's new hires would put the same pressure on another employer's wages regardless of whether a DNCC agreement was in place at the time. Given that Dr. Leamer's "total new hires" variable's constituent parts are not expected to have the same effect on employee compensation under Plaintiffs' overarching theory of harm, it is inappropriate to aggregate them into a single variable in the regression model, which forces the model to estimate a common impact.
- 187. As a correction to the misspecification embodied by the new hires variable, I have estimated Dr. Leamer's compensation regression by splitting his variable into its component parts. As noted above, new hires in category (1) were already taken into account in Dr. Leamer's model, so I have replaced the total new hires variable with 3 new variables allowing me to estimate the differential impact from groups (2), (3), and (4). Splitting apart the new hires variable in this fashion allows the model to reflect variation across firms since each firm has its own unique set of firms with which it has a DNCC agreement(s) in each year of the alleged Class period.
- 188. The added variables comprise a measure of group (2) directly (the new hires at firms with which the employee's firm never had an agreement). To estimate the impact of groups (3) and (4) separately, I include the new hires at the firms with which the employee's firm did have a DNCC agreement both as a standalone variable and interacted with the Class period variable, allowing me to estimate how the impact of this variable changed within the Class period (if at all). This model should improve upon Dr. Leamer's estimation as it allows for greater flexibility and is more consistent structurally with Plaintiffs' theory. In addition, by construction this model takes into account the magnitude of the importance of the DNCC agreements in allegedly suppressing outside opportunities to employees at the firm. If a firm with which the employee's company had a DNCC agreement starts to do more hiring, and thus there are more opportunities for cold calls from which the employee is excluded, the model will automatically react to this via the added new hire variables. The damages estimated by this specification of Dr. Leamer's model

²⁸¹ See Leamer October 2013 Merits Report, Exhibit 2, variable #27.

HIGHLY CONFIDENTIAL - ATTORNEYS' EYES ONLY

Modifications to Dr. Leamer's Regression Model Demonstrate that His Alleged
Damages Amount is Unreliable

- (which adds only flexibility, but does not fundamentally change his approach to damages) are approximately \$543 million. See **Exhibits VI.7** and **VI.8**. ²⁸²
- 189. I have also estimated a version of this model in which the new hires from groups (2), (3), and (4) are scaled by the number of employees currently at the firm, and so represent the number of new hires from the various groups as a share of the firm's extant workforce. This mirrors the fashion in which Dr. Leamer included the new hires from group (1) in his original regression. The results of this model show net overcompensation by the Defendants during the Class period; in fact, only 2005 is estimated to have positive alleged damages, in this case equal to about \$20 million. See **Exhibits VI.11** and **VI.12**.²⁸³
- 190. The results of these minor modifications to Dr. Leamer's compensation regression show that the vast majority of his damage estimate is driven by his overly restrictive specification and unsupported assumption that all of the DNCC agreements had the same impact on all Defendants regardless of how many missed cold-call opportunities were associated with each agreement. Minor modifications to Dr. Leamer's model that are consistent with Plaintiffs' underlying theory and the evidence produced in this case show that Dr. Leamer's damage estimate is unreliable and unconnected to the alleged conduct at issue. Dr. Leamer's measure of the alleged conduct is too blunt an instrument to isolate the impact of the agreements at issue from other concurrent events, and therefore causes him to find damages unreliably.
- 191. In the following section, I discuss other factors that affect Dr. Leamer's damage estimate, but that cannot be corrected within the damages framework that Dr.

Exhibits VI.7 and VI.8 show the results of running Dr. Leamer's model using the modified new hires variables in real terms. The nominal model using modified new hires variables appears in the Appendix (see Appendix Exhibits VI.5 and VI.6) and shows directionally similar results. Another alternative I have estimated is to replace Dr. Leamer's new hires variable with the median income from the tech sector from the previous year, along with the change in the median income from the year before. The median income should capture a similar effect (upward pressure on wages due to the market) without having the issues described above. This model demonstrates how reliant Dr. Leamer's results are on his problematic new hires variable. The median income model not only shows no undercompensation as a result of the conduct at issue, but in fact estimates that the Class was overcompensated by approximately \$3 billion (a figure nearly as large in absolute value as Dr. Leamer's own estimation of alleged damages). See Exhibits VI.9 and VI.10. These exhibits show the results of the model in real terms. The nominal model replacing new hires with median wage appears in the Appendix (see Appendix Exhibits VI.7 and VI.8) and shows directionally similar results.

Exhibits VI.11 and VI.12 show the results of running Dr. Leamer's model using the modified new hires variables calculated as shares in real terms. The nominal model using modified new hires variables calculated as shares appears in the Appendix (see Appendix Exhibits VI.9 and VI.10) and shows directionally similar results. See also Exhibits VI.13 and VI.14. These exhibits show the results of running the model in Exhibits VI.11 and VI.12, but also changing the Class period variable for Intel in 2005 to 0, as discussed above. Similar to those exhibits, this model shows no aggregate alleged damages. These are the results of running Dr. Leamer's model using the modified new hires variables calculated as shares and setting Intel's Class period variable in 2005 to 0 in real terms. The nominal model using modified new hires variables calculated as shares and setting Intel's Class period variable in 2005 to 0 appears in the Appendix (see Appendix Exhibits VI.11 and VI.12) and shows directionally similar results.

Leamer proposes. There is no basis to support Dr. Leamer's opinion that the more than \$3 billion in damages he calculates comes from the alleged conduct at issue as opposed to misspecification of his model or other contemporaneous events such as the 2008-2009 recession.

VII. Dr. Leamer's Aggregate Damage Model Is Too General

- 192. The review in the background section of the Defendants' compensation practices and events over the relevant period suggests the following: 1) the total and average compensation to the Class has trended upward in the Class period for all of these Defendants, and 2) despite volatility due to events that may have affected compensation, there does not appear to be a consistent pattern of changes to compensation practices at these firms concurrent with the timing of the DNCC agreements.
- 193. Several events that affected compensation occurred during the Class period. Examples include Adobe's elimination of its profit sharing program in 2009, Apple's reduction in the number of stock awards to employees in 2008, Google's Forever grant program in 2007 and Intel's hiring freeze in 2006.²⁸⁴ Despite the drops in Class compensation during the Class period as a result of such changes, none of these events have been shown by Plaintiffs to be the result of Defendants' alleged conspiracy to suppress compensation through the implementation of DNCC agreements. In addition, some of the compensation events that occurred during the Class period had a positive impact on Class compensation, such as the increase in Adobe's benchmark targets in 2008, Intel's Option Exchange program in 2009, and the increase in Google's benchmark target in 2007.²⁸⁵ Some of these events were publicly announced in financial documents or to the Defendants' employees.
- 194. Despite occasional decreases in average compensation, the overall trend through the relevant period has been for average Class member compensation to increase. The exhibits described in Section III do not suggest an overall change in pattern to average compensation, or any aspect of compensation, that was implemented during the period of alleged conduct. Despite the lack of visible suppression to the compensation of the Class, Dr. Leamer's very general model finds substantial damages payable to every member of the Class.
- 195. Most of Dr. Leamer's \$3 billion in damages are generated from his Class period indicator variable. However, Dr. Leamer's Class period variable is incapable of isolating the impact of the alleged conduct on compensation from other concurrent

_

²⁸⁴ See III.A.1; III.A.2; III.A.3 and III.A.4.

²⁸⁵ See III.A.1: III.A.3 and III.A.4.

²⁸⁶ See **Exhibit V.12**.

events. We call this kind of an indicator variable a Fixed Effect, because it is designed to account for things that are "fixed" across what it is covering, in this case time, Defendants, and individual Class members. An indicator variable estimates a single effect on the dependent variable for all observations where it is turned on.

- 196. There are at least four problems with Dr. Leamer's Class period fixed effect:²⁸⁷ 1) it does not allow for an impact of the 2008-2009 recession that would negatively have affected compensation for substantial parts of the Class during these years; 2) it does not allow for variation in how each of the Defendants responded to the recession when setting compensation; 3) it cannot identify employees who continued to receive market driven pay increases based on cold-calls or raises due to pressure from non-Defendant rival employers; and 4) it conflates the impact, if any, of the challenged agreements with the logically similar impact of concurrent agreements with similar terms that were entered into at roughly the same time as the agreements in question.
- 197. The inability of Dr. Leamer's model to disentangle the impact of the alleged conduct at issue from the effect on compensation of independent events outside the control of the Defendants makes his damage model unreliable and causes Dr. Leamer to overstate damages, if indeed there are any.

A. Dr. Leamer's Damage Model Does Not Account for the Negative Impact of the Recession on Compensation Outcomes

- 198. In his October 2012 report, Leamer says that the effect of the DNCC agreements on employee compensation can be estimated "by contrasting compensation during the period when the Agreements were in effect with compensation before and after" that period. He goes on to state that a "search for comparison periods needs to be sensitive to the economic cycle," including the "severe global recession" in 2008 and 2009. Also services that the effect of the DNCC agreements on employee compensation during the period when the Agreements were in effect with compensation before and after" that period. The goes on to state that a "search for comparison periods needs to be sensitive to the economic cycle," including the "severe global recession" in 2008 and 2009.
- 199. In his "preliminary informal impact assessment," Dr. Leamer observes that the recession years, 2008 and 2009, fall during the Class period, but a direct comparison to the outside Class years may not be possible. ²⁹⁰ By this he means, without a "severe global recession" outside of the Class period, there is no benchmark for the kind of wage growth to expect during this kind of economic

²⁸⁷ The other Class period variables in Dr. Leamer's model are all interacted with his Class period indicator variable, and are therefore subject to the same concerns.

²⁸⁸ Leamer October 2012 report, ¶ 136.

²⁸⁹ Leamer October 2012 report, ¶ 137.

²⁹⁰ Leamer October 2012 report, ¶ 140.

disturbance when compensation setting is free from the influence of the DNCC agreements. To address the recession in his preliminary informal impact assessment, he gave 2008 and 2009 zero values for the "estimated underpayment" in each year, based on "the idea that the weak economy would not have resulted in increases in those periods."²⁹¹

- 200. At the conclusion of this preliminary impact assessment, Dr. Leamer states that "[r]egression analysis is a better approach because it allows the choice of comparison period to be "constructed" statistically," but his approach to identifying the impact of the Class period still uses the same comparison periods. Moreover, despite the importance of being sensitive to economic downturns, Dr. Leamer does not control for the impact of the recession on the Defendants' compensation in his regression model. ²⁹³
- 201. Applying the same technique that Dr. Leamer applied in his preliminary impact assessment of zeroing out the contribution of 2008 and 2009 on cumulative damages reduces Dr. Leamer's damage estimate for the Class to about \$1.2 billion, which indicates that the recession years contribute to more than half of his total damage estimate. As I discussed in the compensation sections in the background section, each Defendant had a different approach to compensation in the face of the financial uncertainty generated by the recession. In 2009, Intel instituted a pay freeze and Adobe suspended its profit-sharing programs and did not grant bonus awards, while Apple continued merit increases similarly to other years.²⁹⁴
- 202. A simple way for identifying whether the recession years are an important factor in Dr. Leamer's damage estimation is to isolate each year's effect on compensation during the Class period.²⁹⁵ As with Dr. Leamer's model, the annual coefficients on the Class period years are insignificant at 5 percent. However, to analyze which years contribute the most to his damage estimate, I list the coefficient on the individual Class period-year indicators in the table below. In 2005 and 2006, the coefficient on Class period is positive, suggesting that none of Dr. Leamer's damages amount is being driven by compensation outcomes in these years. Instead,

 $^{^{291}}$ Leamer October 2012 report, \P 140.

²⁹² Leamer October 2012 report, ¶ 141.

²⁹³ Leamer Deposition Vol. III., pp. 992 − 3. ("Q: Now you would agree that your model should account for the impact of the recession that occurred in 2008 and 2009? A: That's correct. Q: In fact the model should account for the impact of any significant downturn or upturn during the conduct period? A: That's correct.")

²⁹⁴ See III.A.1; III.A.2 and III.A.3.

²⁹⁵ This solution replaces Dr. Leamer's single fixed effect with five fixed effects. This solves the problems relating to changes within the Class period. However, since these are still fixed effects, many of the other problems discussed in this section will also be true for these values. Therefore, this analysis is more of a way to isolate the impact of the recession, than it is a way to solve the flaws in Dr. Leamer's model.

all of the impact being measured by Dr. Leamer's Class period variable is being driven by the last three years of his Class period. See **Exhibits VII.1** and **VII.2**. ²⁹⁶

Table 2

Coefficients on Class Period-Year Indicators

<u>Variable</u>	Coefficient
conduct_2005	0.16
conduct_2006	0
conduct_2007	-0.08
conduct_2008	-0.09
conduct_2009	-0.41

- 203. It is not possible to control for events that affected employees at individual firms in specific years within Dr. Leamer's model. One theoretical approach to doing so would be to add annual fixed effect variables for each individual Defendant sixty additional variables. However, there are insufficient degrees of freedom in Dr. Leamer's model to include individual Defendant's annual fixed effects, even though the impact of the recession is certainly independent of the conduct at issue, and each firm reacted to the recession in different ways. Similarly, while running separate regressions for each of the Defendants that include annual fixed effects would potentially cure the problem, that solution can also not be implemented because the models will not have enough degrees of freedom in the individual regressions.
- 204. Finally, as noted above, the economy began to turn around in 2009, which is coincident in time with the end of Dr. Leamer's Class period. The coincidence in time of the economic recovery and end of the Class period means that Dr. Leamer's model cannot determine how much of the compensation improvement outside the Class period should be assigned to the end of the recession and how much should be assigned to the end of the DNCC agreements.

²⁹⁶ **Exhibits VII.1** and **VII.2** show the results of running Dr. Leamer's model interacting the Class period variable with annual indicators in real terms. The nominal model interacting the Class period variable with annual indicators appears in the Appendix (see Appendix **Exhibits VII.1** and **VII.2**) and generally shows directionally similar results.

²⁹⁷ Learner December 2012 Reply Report, ¶ 101. ("Complete disaggregation would require an entirely distinct model for each Defendant...this would reduce the number to at most 11 annual observations for each Defendant, and it would be impossible to estimate a model of the scope of mine with so few time-series experiments.")

B. Dr. Leamer's Model Cannot Distinguish Employees who Received Market Wages and are Unharmed from Employees who Allegedly Failed to Benefit from Any Ripple Effect

205. Dr. Leamer's Class period indicator generates a suppression percentage in each year for all individuals in each firm. Even employees that received the largest raises in compensation in each year are estimated to have experienced compensation suppression from Dr. Leamer's Class period variable, even if the compensation changes were deliberately designed to retain an employee who had an external job offer. Moreover, because Dr. Leamer measures impact as a percentage of compensation regardless of each Class member's compensation history, Class members who received substantial raises, putting them at the top of the compensation distribution for their firm, are estimated to have the greatest damages at each firm.

206.	The most dramatic examples of this issue with Dr. Leamer's model come from the
	Forever Google employees. As discussed above, the Forever Google program
	. ²⁹⁹ Dr. Leamer estimates \$67 million in damages (about
	\$471,000 each) for this small group of employees in the same year of their
	substantial Forever Google grants. These employees have an average suppression
	percentage of 14 percent and their damages represent almost 9 percent of Google's
	overall damages. Despite the large salary increases, Dr. Leamer's model assigns
	these Class members a disproportionate share of the damages. The Class
	employees that received the Forever Google grants received

207. While Dr. Leamer finds these employees were significantly harmed due to an alleged reduction in information about their market worth, an email from the period shows that Google believed these grants were

no basis to believe that (1) Google was suppressing these employees' wages or (2)

²⁹⁸ See Section IV.E.2.d.

²⁹⁹ Dr. Leamer's regression data.

³⁰⁰Dr. Leamer's regression data.

³⁰¹ Letter from Laszlo Bock, GOOG-HIGH-TECH-00519082.

- 208. Moreover, Dr. Leamer interacts his Class period indicator with age and age squared which he claims "explicitly allows for the possibility that the effect on compensation levels is different for young employees and for employees with short tenure at their firms, and so the effect of the agreements on employees at a firm might vary according to the firm's composition in this regard." Setting aside persistence effects, what Dr. Leamer actually does is give the same suppression percentage in each year for all individuals in a particular company with the same age. Even employees that received the largest raises in compensation in each year receive the same percentage suppression from Dr. Leamer's Class period variables as all the other employees in their age cohort.
- 209. For example, Exhibit VII.3 compares two Google employees who were employed over Dr. Leamer's entire Class period and who were the same age and had a similar income in 2005. Based on Dr. Leamer's model these two employees were similarly situated, and in each year have the exact same suppression percentages. The first employee was a Forever Google grant recipient and the second employee was not. Over the course of Dr. Leamer's Class period the first employee earned almost and was undercompensated by almost . By contrast, the second and was undercompensated by almost employee earned just over . These results run contrary to Dr. Leamer's theory of harm. The employee who Google was concerned about retaining received the kind of preemptive change in compensation that Dr. Leamer claims is expected, vet is determined to have been harmed by more than 6-times a similarly situated colleague who did not receive the preemptive compensation change.

C. Dr. Leamer's Model Cannot Distinguish the Impact, if any, of the Challenged DNCC Agreements from Other DNCC Agreements

210. As noted above, Dr. Leamer treats all of the DNCC agreements in the same fashion regardless of the importance of each firm with which it has a DNCC agreement to the flow of information to the firm's TCR employees. Even if Dr. Leamer had established that DNCC agreements meaningfully affected information flow to the Class and did so in a uniform manner, his compensation model cannot distinguish between the DNCC agreements at issue and those that are not part of this case. In his October 2012 report, Leamer points out that Defendants potentially entered into several other agreements during the Class period. Because these agreements

³⁰² Leamer December 2012 Reply Report, ¶ 30.

³⁰³ "I also understand that Defendants entered into several additional agreements. Those agreements include: (1) an agreement between Pixar and Intel that began in approximately October 2008, and (2) agreements Apple apparently had with Intel, Intuit, and Lucasfilm." (Leamer October 2012 Report, ¶ 22.)

were allegedly entered into during the Class period, the impact, if any, of these unchallenged agreements is conflated with the impact, if any, of the agreements challenged as unlawful in this lawsuit.

D. Dr. Leamer's Fixed Effect Is Too Blunt to Accurately Estimate the Impact of the Alleged Conduct

- 211. As discussed in the preceding sections, the Class period fixed effect used by Dr. Leamer in his compensation regression captures all of the variation associated with the Class period, regardless of whether or not it was related to the DNCC agreements. The result of this is that the estimated "under compensation" alleged by Dr. Leamer is in fact a broad average of many different factors.
- 212. **Exhibits VI.3** and **VI.4** display the results of Dr. Leamer's compensation regression assuming that Intel did not begin participating in the alleged conspiracy until 2006. As one would expect, Intel's alleged damages are reduced by starting the Class period indicator for Intel in 2006. However, a result that is less intuitive is that the alleged damages calculated by the model also change for the other six Defendants, despite no change in how those six Defendants' alleged conduct is measured. Approximately one-third of Dr. Leamer's estimated damages for Adobe, Apple, Google, Intuit, Lucasfilm, and Pixar disappear despite the fact that no change was made to any of the variables or related to the other firms or the values of any of the individuals in the data. This demonstrates how Dr. Leamer's fixed effect captures the full amount of variation for the period in which it is turned "on," such that the estimation of damages for (for example) Adobe is altered even without any alteration in Adobe's compensation behavior or conduct at issue.
- 213. This example shows the danger of aggregating impact into one, averaged, fixed effect variable. The fact that changes to Intel, for example, have such a profound effect on the other Defendants demonstrates that the instrument he uses to gauge the impact, if any, of the conduct at issue is not nearly granular enough to provide a reliable estimate of damages.

VIII. Summary

214. Dr. Leamer has not put forward any reliable evidence that Defendants' DNCC agreements have caused harm to Plaintiffs. Dr. Leamer did not analyze the impact of the agreements at issue on information available to the Class, and he has no basis to assume that information was even diminished during the alleged Class period. Average compensation to the Class increased overall from 2005 to 2010 and declines in compensation during that period are related to economic events unrelated to the DNCC agreements. Dr. Leamer's damage model contains flaws that make it unreliable. His model suffers from specification errors and yields

counter-intuitive signs, rendering his results meaningless. Moreover, his model is not robust and minor changes to his damage model greatly diminish or eliminate any damages. As a result, Dr. Leamer's model cannot be used to estimate damages reliably.

Signed this 25th day of November, 2013:

Exhibit 1

LAUREN J. STIROH Senior Vice President

Dr. Stiroh specializes in the economics of antitrust, intellectual property, and commercial damages. She has conducted research, prepared expert reports, and testified in court on a variety of issues arising from antitrust allegations such as monopolization, exclusionary conduct, tying, vertical restrictions, price fixing, predatory pricing, price discrimination, and abuse of standard setting. Dr. Stiroh has analyzed the competitive effects of mergers, acquisitions, and joint ventures. She has also written expert reports and consulted on matters related to assessing impact and damages in class action litigation. She has performed or critiqued damage calculations in more than a dozen industrial settings.

Dr. Stiroh has also written and testified on the subject of intellectual property value and valuation. She has assessed and critiqued damages from patent, copyright, and trademark infringement in industries including semiconductors, biotechnology, pharmaceuticals, medical devices, and consumer products. Dr. Stiroh is co-editor and contributing author of *Economic Approaches to Intellectual Property Policy*, *Litigation and Management*, published in 2005.

Much of Dr. Stiroh's work and research focuses on the intersection of antitrust and intellectual property litigation. She has written articles and given speeches on this subject for the American Bar Association, Law Seminars International, the Practicing Law Institute, and the 2002 US Department of Justice and Federal Trade Commission joint hearings on "Competition and Intellectual Property Law and Policy in the Knowledge-Based Economy." She has analyzed market power in technology markets and evaluated the competitive implications of licensing arrangements, including tying and patent pooling provisions. In 2010 she participated in the ABA Stanford Law School Symposium on Antitrust and Innovation.

Dr. Stiroh has presented her research before the FTC, the DOJ, the Canadian Competition Bureau, and in expert testimony. In 2010 she was inducted into the YWCA-NYC Academy of Women Leaders.

Dr. Stiroh holds a Ph.D. in Economics from Harvard University, an M.A. in Economics from the University of British Columbia and a B.A. in Economics from the University of Western Ontario.

C	From DNCC	Agreement Firms	(p)	30	145	134	309
		Period	(a)	Pre-conduct	Conduct	Post-conduct	Total

Notes:

Employee counts are based on the number of employees identified as technical, creative and R&D employees

in Dr. Leamer's regression data.

New hires do not include acquisitions.

The conduct periods are defined as described in Figure 1 of Dr. Leamer's Class Certification Report.

The conduct period starts in January 2001 for Lucasfilm and Pixar, February 2005 for Apple and Google, March 2005 for Intel,

May 2005 for Adobe, and June 2007 for Intuit and ends After March 2009. The pre-conduct period for each Defendant is

from 2001 to the aforementioned dates. The post-conduct period starts after March 2009 and goes through 2011.

Adobe has a DNCC agreement with Apple.

Apple has DNCC agreements with Adobe, Google, and Pixar.

Google has DNCC agreements with Apple, Intel, and Intuit.

Intel has a DNCC agreement with Google.

Lucasfilm has a DNCC agreement with Pixar. Intuit has a DNCC agreement with Google.

Lucasfilm job title information is unavailable prior to 2006.

Only job titles with at least 25 employees in any single year have been included, with the exception of Lucasfilm. Lucasfilm titles have been included if they had at least 15 employees in any single year. Percent changes in compensation only take account of employees present in the data with that title for the previous year.

Notes:

Regression run using base salary as the dependent variable.

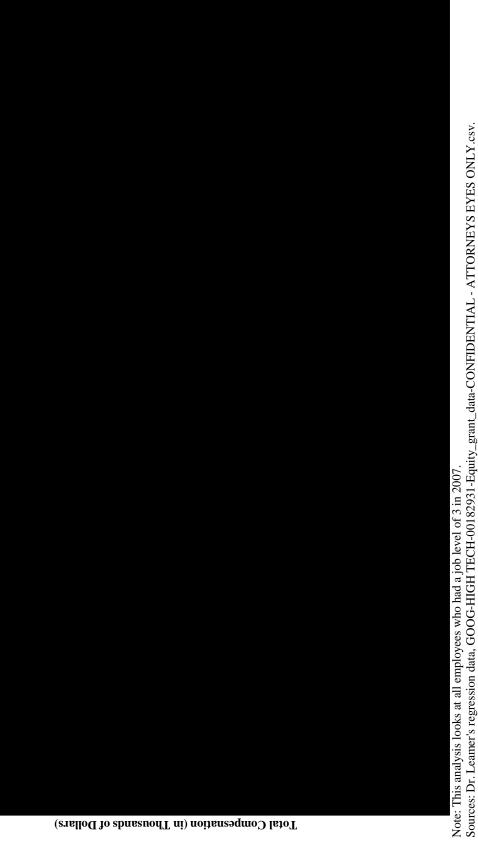

Figures in parentheses indicate overcompensation and therefore no damages.

Base salary includes any overtime payment received by the Class.

Notes

Member's firm's persistence coefficients (see variables #5-18 in Exhibit 2, Leamer October 2013 Merits Report) and that particular year. If a Class Member was also estimated to have been under compensated in the previous year or But-for" compensation, alleged damages, and alleged damages percentages are calculated as in the Leamer October 2013 Merits Report. Dr. Leamer multiplies the 4 conduct-related coefficients (variables #1-4 in Exhibit 2, Leamer compensation for the current year. This percentage is then multiplied by the Class Member's actual compensation, October 2013 Merits Report) by the Class Member's relevant variable values (e.g. the Class Member's age and the and the product is the alleged damages. The but-for compensation is the sum of the actual compensation and the Class Member's firm's hiring rate) and sums these quantities to calculate the percentage under compensation for these quantities are added to the aforementioned value to arrive at the Class Member's total percentage under two years prior, the under compensation percentages from those previous years are multiplied by the Class alleged damages.

This Exhibit shows all years in which Dr. Leamer has calculated damages for this employee.

Notes:

This regression replaces Dr. Leamer's total new hires variable with the median wage of the combined industry comprising "Computer and Peripheral Equipment Manufacturing" and "Computer Systems Design and Related Services" and the difference of this value from the prior year.

Figures in parentheses indicate overcompensation and therefore no damages.

Motor

This regression divides Dr. Leamer's total new hires variable into Log(Total Number of DNCC New Hires/Number of Employees), Log(Total Number of non-DNCC New Hires/Number of Employees), and Conduct * $\operatorname{Log}(\operatorname{Total}\operatorname{Number}\operatorname{of}\operatorname{DNCC}\operatorname{New}\operatorname{Hires/Number}\operatorname{of}\operatorname{Employees}).$

Figures in parentheses indicate overcompensation and therefore no damages.

Between a Recipient of a Google Forever Grant and Another Google Employee Comparison of Actual and But-For Compensation and Alleged Damages

Highly Confidential -- Attorneys' Eyes Only

"But-for" compensation, alleged damages, and alleged damages percentages are calculated as in the Leamer October 2013 Merits Report. Dr. Leamer multiplies the 4 conduct-related coefficients (variables #1-4 in Exhibit 2, Leamer October 2013 Merits Report) by the Class Member's relevant variable values (e.g. the Class Member's age and the Class Member's firm's hiring rate) and sums these quantities to calculate the percentage under previous years are multiplied by the Class Member's firm's persistence coefficients (see variables #5-18 in Exhibit 2, Leamer October 2013 Merits Report) and these quantities are added to the aforementioned value to compensation for that particular year. If a Class Member was also estimated to have been under compensated in the previous year or two years prior, the under compensation percentages from those arrive at the Class Member's total percentage under compensation for the current year. This percentage is then multiplied by the Class Member's actual compensation, and the product is the alleged damages. The but-for compensation is the sum of the actual compensation and the alleged damages.

Dr. Leamer's regression data.
